Abstract

The *AFLOW Library of Crystallographic Prototypes* has been extended to include a total of 1,100 common crystal structural prototypes (510 new ones with Part 3), comprising all of the inorganic crystal structures defined in the seven-volume *Strukturbericht* series published in Germany from 1937 through 1943. We cover a history of the *Strukturbericht* designation system, the evolution of the system over time, and the first comprehensive index of inorganic *Strukturbericht* designations ever published.

Keywords: Crystal Structure, Space Groups, Wyckoff Positions, Lattice Vectors, Basis Vectors, Database

1. Introduction

Crystal structure classification began near the dawn of X-ray Crystallography with early works by Wyckoff [1], Ewald's 1927 *Handbuch der Physik* article [2], and the Landolt-Börnstein 1927 supplement [3]. In the next few decades, these catalogs proliferated, including the *Strukturbericht* (Structure Reports) series [4], Pearson's *Handbook of Lattice Spacings and Structures of Metals and Alloys* [5, 6], Smithells's *Metals Reference Book* [7, 8], and Wyckoff's updated *Structure of Crystals* [9]. In later years, *Pearson's Handbook* [10] and *Smithells Metals Reference Book* [11] acquired new editors and even today produce periodic editions. Subsequent works, such as the *Gmelin Handbook* [12], also appear regularly. As online access became the norm at the beginning of this century, electronic resources appeared, including the *American Mineralogist Crystal Structure Database* [13], which compiles the structures of minerals from a variety of sources, and the SpringerMaterials website [14], an extension of *Pearson's Handbook* that also incorporates the Landolt-Börnstein series.

Computational material-property databases have also become available: for example AFLOW (Automatic FLOW for Materials Discovery) [15–17], Novel Materials Discovery (NoMaD) [18], the Materials Project [19], and the Open Quantum Materials Database (OQMD) [20].

While these print and electronic databases contain a vast number of crystal structures, many are not optimized for use in materials computations, *e.g.*, by providing structural information in a format which can be read by one of the common density functional computer codes. In addition, while most of these resources make their data available in standard formats, such as space group/Wyckoff positions or a Crystallographic Information File (CIF) [21], these forms still pose a challenge for novice researchers. Therefore, it is desirable to have a database that addresses both of these concerns.

The AFLOW Library of Crystallographic Prototypes (hereafter AFLOW Prototype Encyclopedia or Prototype Encyclopedia for brevity) [22, 23] has been designed with these objectives in mind. Integrated with the AFLOW computational framework, it can provide structural input for a wide variety of materials computational programs, including VASP [24], Quantum ESPRESSO [25], FHI-AIMS [26], ABINIT [27], and ELK [28] as well as in CIF format. Each structure's web page provides all the necessary crystallographic information, including space group, lattice vectors, and Wyckoff positions. In addition, the formulas for the primitive vectors and basis vectors of the structure are shown. This is particularly useful for students and novice researchers, as it shows the relationship between the standard crystallographic coordinates needed for computational work and the Cartesian positions of the atom in the primitive and/or conventional unit cell. If the desired chemical com-

position for the structure is not the prototype, the chemistry and primitive cell dimensions can be changed by the user before generating the structural input. Finally, the structure may be viewed as a primitive cell, conventional cell, or supercell at a variety of angles and magnifications via JSmol [29].

This article is about the ongoing development of the AFLOW Prototype Encyclopedia. In Part 1 [22], we introduced the Prototype Encyclopedia, which began as an updated version of the now-defunct Naval Research Laboratory "*Structure of Crystals*" web site. This was a collection of crystal structures that we found useful as a starting point for computational studies of materials. One feature of the site was that it included a number of well-known *Strukturbericht* designations, from the German effort to classify common crystal structures [4]. This article also provided a brief introduction of the crystallography needed to understand crystal structures, as well as a description of the entries in the AFLOW Prototype Encyclopedia for each structure. In all, 288 structures were included in the initial Prototype Encyclopedia.

Part 2 [23] continued the discussion of crystallography by reviewing the enantiomorphic space groups, which are pairs of space groups that are mirror images of each other. As part of our teaching mission, we also described the Wigner-Seitz version of the primitive unit cell of a crystal, and discussed the 17 two-dimensional "plane groups," the analog of the 230 three-dimensional space groups. Another 302 structures were added to the database to bring the total to 590, with at least one structure shown in each of the 230 space groups.

In this article, Part 3, we add 510 new structures to the encyclopedia. These include all of the inorganic *Strukturbericht* designations which had not previously been cataloged by us. The *Strukturbericht* classification scheme was one of the earliest attempts to group elements[1] and compounds into common crystal structures. However, despite its historical importance there is no available history of its development, and until now there has been no comprehensive index of all the *Strukturbericht* designations that were defined in the series or added by others.

Recently, M. J. Mehl published a brief history of the development of the *Strukturbericht* designations [31]. In Part 3, we improve and extend that work, beginning with the introduction of these labels by Ewald [2] through the publication of the seven *Strukturbericht* volumes and the post-World War II extensions to the scheme made by Smithells [8], Pearson [5], and others. The *Strukturbericht* classifications changed over the run of the series, and several structures were published under multiple designations. Here, we track all of those changes.

The article is organized as follows: in Sections 2 and 3, we present common prototype classification schemes, followed by a short history of the development and presentation of *Strukturbericht* designations. As the *Strukturbericht* designations changed over time, Section 4 discusses the history of the major categories and sub-categories, as well as our editorial decisions as to which label should be used for a given prototype. Section 5 presents what we believe to be the first comprehensive list of *Strukturbericht* designations for elements and inorganic compounds, including all references to labels which we could find in the literature, with a link to the corresponding online pages in the AFLOW Prototype Encyclopedia. Section 6 describes AFLOW software modules that will be used to identify and classify new prototypes for future iterations of this work. Additionally, Section 7 introduces an online form for users to suggest new prototypes to enrich the Encyclopedia. Section 8 provides information about AFLOW Schools: hands-on workshops for students and researchers to learn about structural analysis methods — especially those discussed in Parts 1, 2, and 3 of this work — as well as other topics related to computational materials science. Section 9 summarizes our conclusions. This is followed by a list of all 510 new prototypes we have included in the Prototype Encyclopedia since the publication of Part 2.

2. Crystallographic Classification Schemes

Just before the First World War, Max von Laue suggested that diffraction of X-rays through crystals would produce a pattern which could be used to determine the crystal structure [32]. Shortly thereafter, this technique was also applied by Bragg and Bragg [33] and Hull [34] to analyze the structures of diamond and graphite, respectively. Over the next decade, the structures of hundreds of elements and compounds were determined [2, 3, 35, 36].

It was soon obvious that nature is in the habit of repeating itself. For example, the metallic elements mostly take close-packed face-centered-cubic (fcc) or hexagonal (hcp) structures, or the nearly close-packed body-centered cubic (bcc) structure. (The major exceptions being manganese, which takes on two unique atomic arrangements, and the actinides.) Of the remaining elements, the early group 14 all take on the diamond structure. We only see other patterns when we go to the far right-hand side of the periodic table.

Similar trends occur in compounds. Many AB type binaries have ground states in the sodium chloride, cesium chloride or zincblende structures, A_2B compounds can frequently have the positions found in fluorite (CaF_2), and metallic compounds of the form A_2BC often appear in the Heusler structure. This continues into more complicated chemistries. Data-mining sources such as AFLOW-ICSD

[1] Of interest is the work of Davey [30], who found that tungsten was too opaque for standard X-ray diffraction techniques, and so diluted his sample with ten parts wheat flour in order to get a diffraction pattern.

show that a large number of compounds exist in a relatively small number of crystal structures [37].

This duplication of structures leads to the assumption that most elements and compounds exist in a relatively small number of crystallographic forms, and that compounds having similar structures are somehow related to one another. If true, then it should be possible to classify crystal structures according to their periodicity and arrangement of atoms in the unit cell. We now show four common classification schemes.

The simplest crystal structure classification is by their space group and the occupied Wyckoff positions within that space group [38]. This is certainly efficient, and we have used a variant of it to index crystal structures [22, 23]. Unfortunately, this description is neither particularly informative nor unique. The ground states of gallium, iodine, and phosphorus are all in space group *Cmca* (#64), and all the atoms occupy a single ($8f$) Wyckoff position [39], but their structures are all different: the iodine atoms form dimers, while gallium and phosphorus have very different conventional unit cells.

A second way of defining classes of crystal structures is to group all similar elements or compounds into one class, and refer to it by one "prototype". Ionic compounds such as NaCl, MgO, BaS, and many others all take the same structure: fcc space group $Fm\bar{3}m$ (#225), with one atom on the ($4a$) Wyckoff site and the other on the ($4b$) site. This is universally known as the "sodium chloride" or "rock salt" structure [35]. This approach works well if there is an agreement on a single prototype for each structure, but can lead to confusion if different researchers use different prototypes: for example, ϵ-FeN_2 and β-VN_2 are both claimed as prototypes for the same structure [10, 40], while the mineral rosiaite ($PbSb_2O_6$), with similar lattice parameters and atomic coordinates [41], is considered the prototype of the ternary form.

A third method was introduced by Pearson [6]: specify the lattice type (cubic, hexagonal, tetragonal, etc.), followed by the number of atoms in the conventional unit cell. These *Pearson Symbols* are a compact version of the first method, and suffer from the same problems.

A fourth method is derived from the second: assign a label to each structure class and refer to it by that label. These came to be called *Strukturbericht* designations, for reasons discussed below. This scheme can prove unwieldy, as there are a potentially infinite number of possible structures, making it impossible for any labeling scheme to keep up, especially if there is no systematic method for choosing the labels. It does have the advantage that there is a unique label for every structure class, independent of chemical composition.

In practice, one identifies the structure using several of these methods. Of the four, the *Strukturbericht* scheme is the most obscure, and so we now turn our attention to it.

3. A Brief History of *Strukturbericht* Symbols [2]

This *Strukturbericht* scheme was introduced by Ewald in his review of X-ray crystallography for the 1927 edition of the *Handbuch der Physik* [2]. The 1927 supplement to the 1923 edition of Landolt-Börnstein [3] also contains a shortened version of Ewald's list, presumably taken from the *Handbuch*, but we have not been able to determine which one was actually published first.

The structural cataloging method devised by Ewald was rather simple:

- Purely elemental structures were given designations beginning with the letter A, followed by a number. Thus, the face-centered cubic lattice, prototype copper, was given the designation $A1$, body-centered cubic (tungsten) $A2$, hexagonal close-packed (magnesium) $A3$, diamond $A4$, and so on. Each new structure was labeled with the next available number, making the scheme rather arbitrary, as there may be no relation between structure An and $An + 1$.

- Binary compounds with composition AB were given designations starting with B: $B1$ (NaCl), $B2$ (CsCl), $B3$ (zincblende ZnS), $B4$ (wurtzite ZnS), *etc.* Thus, we can easily distinguish between the two forms of zinc sulfide.

- Binary compounds with composition AB_2 had designations starting with C, *e.g.*, fluorite (CaF_2) is $C1$.

- Binary compounds A_mB_n start with D. The original $D1$ structure was corundum (Al_2O_3).

- Ternary and higher compounds that do not contain radicals such as SiO_4 or OH have labels beginning with E. The only example was $E1$ ($KMgF_3$).

- The letter F was used for compounds with linear radicals, such as $F1$ [K(CN)].

- "Flat" (two dimensional) radicals start with G: $G1$, calcite ($CaCO_3$).

- "Complex" (three dimensional) radicals were assigned to H: $H1$, anhydrite ($CaSO_4$).

The *Strukturbericht* scheme was refined and extended by various literature reviews. The earliest crystallographic critical review that we have found was published by Wyckoff as part of his seminal 1924 work, *The Structure of Crystals* [1], followed by the 1931 second edition [35], the 1934 supplement edition [42], and culminating in the six-volume second edition of *The Structure of Crystals* from 1963 through 1971 [9].

[2] A somewhat different version of this section appeared in Ref. [31].

In 1931, Ewald and C. Hermann [36] published an exhaustive review of the structural literature from 1913-1928, "*Strukturbericht* (Structure Reports) 1913-1928" (we will refer to this as SB-I) as a supplement to the journal *Zeitschrift für Kristallographie*. In their introduction, they say that the purpose was (translated from German)

> ... to provide a compilation and critical review of *all* [our emphasis] previously published articles on X-ray structure determination. The structures are arranged according to their chemical formulas, at the same time a summary by "types" provides an overview over the known structures and their representatives. Unlike other published structural compositions, the present one stands out by discussing individual works, not just the results of the structures of the crystal types. It is expected that this will improve the accuracy of the structural determinations, the exact nature of the material used, the corrections to be made to older reports due to new experiences, and that other similar points can be assessed better.

The given dates show that this was intended to cover the field of structural studies from the beginning. This volume was primarily a critical review of the current X-ray crystallographic literature, but it also grouped crystal structures into types using the classification scheme defined in the *Handbuch*, leading to the structural prototypes becoming known as *Strukturbericht* designations.

The second (SB-II) and third (SB-III) volumes of *Strukturbericht* were published in 1937, encompassing the years 1928-1932 and 1933-1935, respectively. Each was designed to cover all published crystal structures, or at least all structures which the editors could obtain, for the indicated timeframe. Later volumes (SB-IV through SB-VII) span one year of research each, with the seventh and final volume, including 1939, published in 1943 during the Second World War. At the end of the war, the International Union of Crystallography (IUCr) continued this project, publishing it as *Structure Reports*, in English, through 1990. The first IUCr volume contained research published in 1945-1946 and was designated as volume 10 [43]. Volumes 8 and 9, covering 1940-1941 [44] and 1942-1944, respectively, were published later, providing continuity with the original *Strukturbericht*.

Volumes SB-I-VII modified and extended Ewald's classification scheme, but after the war, it was realized that the number of *Strukturbericht* symbols would keep growing uncontrollably and so the practice of giving new structures symbols was discontinued by the IUCr. A few new symbols were introduced by C. J. Smithells in his 1955 *Metals Reference Book* [8], and by W. B. Pearson in his 1958 *Handbook of Lattice Spacings and Structures of Metals and Alloys* [5]. Several other symbols have been added by other authors, noted in Section 5.

Even though the generation of new symbols ceased, the ones found in the *Strukturbericht* volumes, Smithells, and Pearson are still in use. For example, compounds with the $A15$ structure (Cr_3Si or β-W) became known as the first "high temperature" (20 K) superconductors [45]; and there are frequent references to "$B1$" (NaCl) or "$B2$" (CsCl) structures. Despite this, there is no complete index of all the *Strukturbericht* symbols: an index was published as part of the table of contents for SB-II, but this was not continued into the later volumes. In 1976, Trotter and Bree [46] published a complete index of all the compounds mentioned in all seven volumes, but it was by formula and by author, with no reference to the *Strukturbericht* designations. Smithells, Pearson, and other works such as Villars [10], and Parthé *et al.* [12] have published partial lists, but these are weighted toward the intermetallics and mostly ignore silicates (*Strukturbericht S*) and other non-metallic categories.

While we do not intend to write a complete history of *Strukturbericht* designations, it is worthwhile to give a brief description of the changes in the system that occurred throughout its run. The remainder of this section summarizes the changes to the system made in each volume. Following that, Section 4 delves more deeply into the changes made in each *Strukturbericht* category. Finally, we provide the first complete list of inorganic *Strukturbericht* designations in Section 5. As part of this effort we added all of the inorganic *Strukturbericht* designations as entries in the AFLOW Prototype Encyclopedia, leaving out the very few where the definition was so vague that we could not determine a structure.

3.1. *Strukturbericht* Band (Volume) I 1913-1928

SB-I [36] classified structures using a modified version of the scheme presented in Ewald's *Handbuch* article. This included the introduction of three new *Strukturbericht* categories:

- Type L, "alloys" (*Legierungen*): These are ordered structures based on the fcc and bcc lattices, such as Cu_3Au (*Strukturbericht* $L1_2$), which can be considered as an fcc lattice with an ordered substitution of gold atoms for copper, and the Heusler prototype $AlCu_2Mn$ ($L2_1$), a decoration of the bcc lattice.
- Type M, "solid solutions" (*Mischkristalle*). Presumably this was to be used for solid solutions, but no M-type structures were ever defined.
- Type O, "organic:" These are categories of organic crystals cataloged in a manner similar to the inorganic categories A-L. Type O structures were defined in every volume of *Strukturbericht*, but the labels never became common and we will not discuss them in this article.

In addition to the new categories, SB-I subdivided Ewald's original categories. For example, while type D still

represented binary compounds of the form A_mB_n, the type was divided into ranges, with $D1 - D10$ reserved for compounds AB_3, $D11 - D20$ for AB_n with $n > 3$, and finally, $D50 - D100$ for the more general compounds. Thus, the original $D1$, Al_2O_3, now became $D51$, while $D1$ was used for ammonia, NH_3. Similar divisions were made in the F, G, H and L categories.

The volume itself was divided by *Strukturbericht* category. Each section began with a description of the structures associated with each *Strukturbericht* designation and ended with a review of the literature for these and similar structures. These reviews would be present in all *Strukturbericht* volumes.

3.2. *Strukturbericht* Band II, 1928-1932

SB-II [47] was published in 1937 and covered the years 1928 through 1932. By then, Ewald, protesting the firing of all Jewish professors at the Technische Hochschule Stuttgart, resigned his post and emigrated to the United Kingdom [48], so the volume was edited by Carl Hermann, Otto Lohrmann, and Hans Philipp.

The new publication included a table of contents with the only index of *Strukturbericht* symbols ever published in the original volumes. Scheme changes developed in the *Handbuch* and SB-I were made. The most notable was in the format of the labels for classes D and above, due to the large number of new structures being found. This caused a problem in the D category, where designations $D1$ through $D10$ were reserved for structures with stoichiometry AB_3. By 1932, thirteen unique structures of this type were known, exceeding the category limit. To remedy this, the editors changed the SB-I $D1 - D100$ letter-number format to letter-number-subscript, where now the letter-number combination reveals the stoichiometry of the crystal and the subscript the specific structure. Thus, ammonia (NH_3) formerly $D1$, became $D0_1$; skutterudite, formerly $D2$, became $D0_2$. (Eventually the $D0$ range would extend to $D0_{24}$, Ni_3Ti.) This practice was applied to all of the categories beyond D.

SB-II also introduced the first fourteen entries in the rather general E category, including $E0_1$, PbFCl. Other E entries included chalcopyrite ($CuFeS_2$, $F6_1$), cubic perovskite ($CaTiO_3$, $G0_5$), and ilmenite ($FeTiO_3$, $G0_4$); were reclassified to $E1_1$, $E2_1$, and $E2_2$, respectively, presumably because they were insufficiently radical.

Other new categories were added:

- Type I, compounds with BC_6 radicals. These were mostly renamed from type H, where in SB-I $H50$ and above had been reserved for large radicals. Now, *e.g.*, K_2PtCl_6, originally $H6_1$, was reclassified as $I1_1$, though the SB-II table of contents listed it under both designations. Compounds with radicals of the form BC_m ($m < 6$), remained in the H category, although many SiO_5 silicates were co-listed in the new S category.
- Type K, "complex radicals," including $K0_1$ ($K_2S_2O_5$), $K1_1$ ($K_2S_2O_6$), and $K1_2$ ($Cs_2S_2O_6$). At least that is how they were listed in the text. In the SB-II table of contents, they were listed as $K1_1$, $K2_1$, and $K2_2$, respectively. (We use the names in the text rather than the names in the table of contents below.)
- Type S, the silicates, which were now moved to a new category. The silicates defined in SB-I had mostly been given H designations, but now were also listed under S, at least in the index of SB-II. Thus, kyanite (Al_2SiO_5, originally labeled $H5_1$ or $H51$, acquired the new label $S0_1$. In all, thirty-two compounds were identified, all but six of these new to SB-II.

3.3. *Strukturbericht* Band III, 1933-1935

SB-III was the last multi-year volume of the series, published in 1937 [49]. Edited by C. Gottfried and F. Schlossberger, it covered papers from 1933 through 1935.

This volume did not include any new *Strukturbericht* categories, but, perhaps to avoid confusion between the letters in all Latin alphabets, category I was renamed as category J. Since some of the previously defined I compounds were never mentioned in this or later volumes, we will attempt to resolve this confusion in Sections 4 and 5.

3.4. The War Years: *Strukturbericht* Band IV-VII

Each of the remaining volumes covered a single year and did not introduce any new categories. Remarkably, most were published while World War II was in progress, despite the fact that many German scientists, following Ewald, had fled the country, or like Hermann, had been imprisoned by the Nazi regime [50]. In spite of the War, these later volumes were distributed throughout the world. In 1943 in the United States, Edwards Brothers (Ann Arbor) published all seven volumes "in the Public Interest by Authority of the Alien Property Custodian," an office created by Presidential order to manage enemy alien property [51].

- SB-IV (covering 1936) [52], edited by Gottfried, was published in 1938.
- SB-V (1937) [53], again edited by Gottfried, was published in 1940.
- SB-VI (1938) [54], edited by K. Herrmann (not to be confused with C. Hermann), was published in 1941.
- SB-VII (1939) [55] — the last volume — was again edited by Herrmann and published in 1943, while the Eastern Front with the Soviet Union was collapsing, the Allies were invading Italy, and preparations for D-Day were underway. SB-VII begins by noting that scandium is face-centered cubic and so is an $A1$ structure, and ends with an entry for cronstedtite, $Fe^{II}_4Fe^{III}_2[(OH)_8|Fe^{III}_2Si_2O_{10}]$, assigning it the designation $S5_7$. This is the final inorganic *Strukturbericht* designation given in the original series.

3.5. Post-War: Continuation and Extension of *Strukturbericht*

The classification of compounds into *Strukturbericht* designations discontinued in the IUCr's post-war *Structure Reports*, but two authors created new designations as part of their own structural compilations. In 1949, Colin J. Smithells published his first *Metals Reference Book* [7], which included a partial index of *Strukturbericht* designations and the crystal structure associated with each. This list concentrated on metallic systems, and so left out some elements and compounds. This was not just a list of previously defined types, however. Smithells listed two new compounds: $ThSi_2$, and $TeCu_2$, provisionally giving them the *Strukturbericht* designation C_x. In the second edition of *Metals Reference* [8], Smithells extended this, adding many new *Strukturbericht* designations. While still following the letter-number-subscript scheme started in *Strukturbericht* II, the subscripts for the new entries were alphabetic rather than numeric. Thus, $ThSi_2$ became *Strukturbericht* type C_c and $TeCu_2$ became C_g. Reflecting the advances in physics in the war and post-war era, the list included the unique structures of the actinides: A_a (Pa), A_b (β-U), A_c (α-Np), A_d (β-Np), etc. Altogether Smithells added seventy-five new structures to the list.

In 1958, Pearson published the first edition of his influential *Handbook of Lattice Spacings and Structures of Metals and Alloys* [5]. It included most of Smithells' *Strukturbericht* index and added ten new structures, using the letter-number-alphabetic subscript format, with subscripts chosen to avoid overlap with Smithells. Pearson soon realized that further extensions would become unwieldy. In the next edition of his Handbook [6], he dropped the *Strukturbericht* index and listed structures by their Pearson symbols, which are not arbitrary and have the advantage of making the crystal type and number of atoms readily apparent, at the cost of having numerous structures of wildly different types using the same symbol. He still, however, gave the *Strukturbericht* designation for systems he was describing, a practice that continues in the modern editions of *Pearson's Handbook*.

3.6. Modern indices of compounds

Despite the demise of the *Strukturbericht* labeling system, it is still useful to have lists which classify crystal structures. Several authors and groups have done this over the years:

- Trotter and Bree [46] published an index to the original seven volumes of *Strukturbericht*, including both organic and inorganic structures. Regrettably, it did not include an index by *Strukturbericht* designation.
- Modern versions of *Pearson's Handbook* [10] and *Smithells Metals Reference Book* [11] include indices of metallic structures by *Strukturbericht* designation, Pearson symbol, and space group.
- The *Gmelin Handbook of Inorganic and Organometallic Chemistry* [12] also includes a list of *Strukturbericht* designations, as well as the Pearson symbol, space group, and occupied Wyckoff positions for each structure. Unlike the Pearson and Smithells Handbooks, this list includes many non-metallic systems. The list also notes when two *Strukturbericht* designations actually refer to the same structure. This happened several times in the original works, undoubtedly due to the frequent changes of editors and the lack of computers to keep accurate databases.
- The modern versions of Smithells, Pearson and Gmelin also include other structures not given a *Strukturbericht* designation.

Electronic databases are also available:

- *The American Mineralogist Crystal Structure Database* [13] gives structural information for a large number of minerals (including mineral names), but does not include the *Strukturbericht* designation. It does list the source publication, and when possible links to its PDF version. The site includes all structures published in *American Mineralogist*, *The Canadian Mineralogist*, *European Journal of Mineralogy*, and *Physics and Chemistry of Minerals*, as well as other sources.
- *Springer Materials* [14] maintains a constantly updated list of crystal structures. Edited by P. Villars, this is essentially an electronic form of *Pearson's Handbook*, but it includes non-metallic systems as well, unfortunately neglecting *Strukturbericht* designations.

None of these lists and databases give a comprehensive list of *Strukturbericht* symbols. In 1995, R. Benjamin Young, a summer intern at the U.S. Naval Research Laboratory in Washington D.C., and M. J. Mehl created an online database of *Strukturbericht* and related structures, in what was called the *Crystal Lattice Structures* web site, currently offline. In 2016, Mehl joined with the Curtarolo Research Group at Duke University to create the AFLOW Prototype Encyclopedia as an updated version of of the original website.

The original database contained 288 structures, including many, but not nearly all, of the inorganic *Strukturbericht* designations. It was later expanded [23] to 590 structures, and with this publication increases the count to well over 1,000, including all of the inorganic *Strukturbericht* designations from the original volumes, Smithells, Pearson, and other sources (see Section 5). We will continue to add new structures (Section 6), and invite readers to suggest prototypes (Section 7).

AFLOW Prototype Encyclopedia lists structures by *Strukturbericht* (if any), Pearson symbol, space group and prototype material. Each entry includes:

- The *Strukturbericht* designation of the structure, if one has been given,
- the Pearson symbol
- the space group,
- occupied Wyckoff positions,
- primitive vectors for the lattice,
- basis vectors for each atom in the primitive unit cell,
- a rotatable view of the primitive or conventional unit cell, which can be expanded to show multiple unit cells,
- a standardized Crystallographic Information File (CIF), and
- a structure file which can be used as input for a variety of electronic structure codes.

4. *Strukturbericht* categories and subcategories.

The original *Strukturbericht* scheme developed by Ewald was modified and extended over the years, and until now there has been no comprehensive list of *Strukturbericht* categories or designations. This section and the next correct this omission. Here we describe all the primary (A, B, C, ...) *Strukturbericht* categories, while the next section will list every *Strukturbericht* designation.

Primary categories from D through S are broken into smaller secondary categories, *e.g.*, $D0$, $E1$, $F2$, which we will describe as well. As the various primary and secondary categories changed over time, we offer a brief description of the changes in each category introduced over the course of the *Strukturbericht* publication run.

***A*:** Elements – this is essentially unchanged from Ewald's original *Handbuch* article.

***B*:** Binary compounds with stoichiometry AB – again unchanged from the original list.

***C*:** Binary compounds with stoichiometry AB_2 – also unchanged.

***D*:** Binary compounds with stoichiometry A_mB_n, beyond AB and AB_2.

In the *Handbuch*, this was just a list of compounds, in no particular order. SB-I changed this by introducing ranges corresponding to a given stoichiometry, so that compounds with the same m and n were in the same secondary category. Originally, these categories held at most ten compounds, *e.g.*, $D1 - D10$ for AB_3. In SB-II this was changed to the letter-numeral-subscript format described in the previous section:

***D0*:** (originally $D1 - D10$) Binary compounds with stoichiometry AB_3.

***D1*:** ($D11 - D20$) Binary compounds with stoichiometry AB_4. In SB-I, it was defined for all AB_n structure with $n > 3$, but all the examples given were AB_4.

***D2*:** This should have been the range $D21 - D30$, but this was not listed in SB-I. Starting with SB-II, it was used for binary compounds of stoichiometry AB_n, $n > 4$.

***D3*:** Binary compounds with stoichiometry $(AB)_2$.

***D4*:** Binary compounds with stoichiometry $(AB_n)_2$, $n > 1$.

Obviously, these last two categories can also be indexed in B, C or $D0 - D2$ by reducing the stoichiometries. The stoichiometry for $D3$ (A_2B_2) reduces to that of B (AB). Similarly, the stoichiometry for $D4$ can be reduced (A_2B_{2n} to AB_n), which is equivalent to C when $n = 2$, $D0$ when $n = 3$, $D1$ when $n = 4$, and $D2$ when $n > 4$. Therefore, only one compound was defined in $D3$ and $D4$.

The remaining secondary categories in D were listed together in SB-I as $D50 - D100$, and only implicitly divided into other categories in later volumes. This is our best interpretation of the method:

***D5*:** Binary compounds with stoichiometry A_2B_3.

***D6*:** Binary compounds with stoichiometry A_2B_4 – this is violated in SB-I by the first entry $D61$, but it seems to be latter editors' intent to define it in this way.

***D7*:** Binary compounds with stoichiometry A_3B_4.

***D8*:** Binary compounds with stoichiometry A_mB_n that do not fit into previous categories.

***D10*:** This was only defined post-war by Pearson, who used it for compounds with stoichiometry A_3B_7.

***E*:** Ternary and more complex compounds.

In the original *Handbuch* article, the E label was to be used for general multi-atom compounds that contained radicals. No E structures were introduced in SB-I, but subsequent volumes defined several secondary types, all involving ternary compounds:

***E0*:** Ternary compounds with stoichiometry ABC.

***E1*:** Ternary compounds with stoichiometry ABC_2.

***E2*:** Ternary compounds with stoichiometry ABC_n, $n > 2$.

***E3*:** Ternary compounds with stoichiometry AB_2C_n, $1 < n < 5$.

Pearson [5] gives $CdAl_2S_4$ the designation $E3$, without any subscript. It should be defined as

$E3_a$, but as he did not put any other structures into this subcategory, we will leave it as is.

$E4$: Ternary compounds with stoichiometry AB_2C_5.

$E5$: Ternary compounds with stoichiometry AB_2C_n, $5 < n < 8$.

$E6$: Ternary compounds with stoichiometry AB_2C_8.

$E7$: Never defined.

$E8$: Ternary compounds with stoichiometry $A_2B_2C_n$.

$E9$: Other ternary and quaternary compounds.

F: Compounds with two- and three- atom radicals.

Originally, compounds of the form $A_m(BC)_n$, where "BC" form a radical, were to be given designations in the range $F1-F50$, with higher numbers for $A_m(BC_2)_n$ and $A_m(BCD)_n$ compounds. With the publication of SB-II, this became:

$F0$: Compounds with stoichiometry $A(BC)$.

$F1$: Compounds with stoichiometry $A(BC)_2$.

$F2$: Compounds with stoichiometry $A(BC)_m$, $m > 2$.

$F3$: Never defined.

$F4$: Compounds with stoichiometry $A_2(BC)_m$.

$F5$: Compounds with stoichiometry $A_m(BC_2)$ or $A_m(BCD)$.

$F6$: Additional compounds with stoichiometry $A_m(BC_2)$ or $A_m(BCD)$.

$F6$ was only used in SB-I for $F61$ (now $F6_1$), $CuFeS_2$ chalcopyrite.

Here, as well as in categories G-J, the letter "A" may represent more than one atom.

G: Compounds with radicals of the form (BC_3):

$G0$: Compounds with stoichiometry $A(BC_3)$.

$G1$: Compounds with stoichiometry $AD(BC_3)$.

$G2$: Compounds with stoichiometry $A(BC_3)_2$.

$G3$: Compounds with higher order (BC_3) radicals.

$G4$: Never defined.

$G5$: Compounds with BO_3 and PO_3 radicals.

H: Compounds with radicals of the form $(BC_n, n > 3)$.

This was originally a catch-all category, but in SB-II, compounds which would have been labeled as $H6$ and up were moved to a new class, I, and most silicates (SiO_n) were moved to S. This means that some structures have multiple *Strukturbericht* listings, so we will describe the complete H class here. The SB-II table of contents listed some compounds in both the H and I categories:

$H0$: Compounds with stoichiometry $A(BC_4)$.

$H1$: Compounds with stoichiometry $A_2(BC_4)$ or $AD(BC_4)$.

$H2$: More complex compounds with only one (BC_4) radical.

$H3$: Compounds with multiple (BC_4) radicals.

$H4$: Hydrated compounds with (BC_4) radicals.

$H5$: Compounds with (BC_5) radicals.

$H6$: Compounds with stoichiometry $A_2(BC_6)$.

This became $I1$ in SB-II and $J1$ in SB-III. $H6_2$ and $H6_4$ were only referred to as $I1_2$ and $I1_4$ in the SB-II table of contents, so we use the $H6$ designation in the list below. The examples given for $H6_3$ and $I1_3$ are rather different, so we use $H6_3$ for the original prototype $K_2Pt(SCN)_6$ and $I1_3$ for $SrCl_2{\cdot}(H_2O)_6$ as given in SB-II.

$H7$: Compounds with stoichiometry $A_3(BC_6)$.

This became $I2$ in SB-II and $J2$ in SB-III.

I: Compounds with radicals of the form $A_m(BC_6)$.

This was introduced in SB-II, essentially transferring $H6$ to $I1$, $H7$ to $I2$, etc.:

$I1$: Compounds with stoichiometry $A_2(BC_6)$.

$I2$: Compounds with stoichiometry $A_3(BC_6)$.

$I3$: Never defined.

$I4$: Never defined.

$I5$: Never defined.

$I6$: Compounds with stoichiometry $A_6(BC_6)$.

The only structure listed here is $Ni(H_2O)_6SnCl_6$ ($I6_1$), which should have been subcategory $I5$ if the scheme laid out for $I1$ and $I2$ was used. It may have been the editors' intent to use this for hydrated systems. The $I6_1$ structure was never listed as $J6_1$, so we leave it in the I category in the AFLOW Prototype Encyclopedia.

J: Compounds with radicals of the form $A_m(BC_6)$.

As noted above, this is the same category as I in SB-II, renamed in SB-III. Some structures in the I category were never renamed, and so we have left them with the I designation in Section 5:

$J1$: Compounds with stoichiometry $A_2(BC_6)$.

$J2$: Compounds with stoichiometry $A_3(BC_6)$.

$J3$: Compounds with stoichiometry $A_3(BC_6) \cdot mH_2O$.

The only structure with this designation is $K_3TlCl_6{\cdot}\ 2H_2O$, from which we infer the editors' intent.

***K*:** Compounds with more complicated radicals.

The intended range of these labels is open to question, as many of the entries have only one or two compounds:

- ***K*0:** Compounds with radicals of the form B_2C_n, $n < 6$.
- ***K*1:** Compounds with radicals of the form B_2C_n, $n = 6$.

  There is some confusion in this category. SB-II defines $K1_1$ $K_2S_2O_6$ and $K1_2$ $Ca_2S_2O_6$ in the text but uses $K2_1$ and $K2_2$ for the same structures in the table of contents. We use the labels in the actual text.
- ***K*2:** Never defined, except in the index of SB-II.
- ***K*3:** Compounds with radicals of the form B_mC_5.
- ***K*4:** Compounds with radicals of the form B_2C_n, $n > 5$.
- ***K*5:** Compounds with radicals of the form B_3C_n.
- ***K*6:** Compounds with radicals of the form B_mC_7.
- ***K*7:** Compounds with radicals of the form B_mC_n, $m < n$, $n > 7$.

***L*:** Alloys.

These are ordered intermetallic systems. To determine the subcategory, start with an elemental lattice, say fcc ($A1$), construct a supercell of that lattice, and populate that supercell with various atomic types, so that on average the structure looks like the original fcc lattice, even though it is an ordered crystal. This category could in principle be used with any of the lattices found in part A, *e.g.*, zincblende $B3$, a derivative of the diamond structure, and could have been listed as $L4_1$. In practice, though, only a few such structures were defined:

- ***L*1:** Supercells of the face-centered cubic (fcc) structure, $A1$.
- ***L*2:** Supercells of the body-centered cubic (bcc) structure, $A2$.
- ***L*3:** Supercells of the hexagonal-close-packed (hcp) structure, $A3$.
- ***L*6:** Supercells of the body-centered tetragonal (bct) structure, $A6$.

There are also labels such as $L'1_0$, Fe_4N. These indicate interstitial additions to the supercell. In this case, the atoms in Fe_3N are on fcc sites, and the extra iron atom is in the octahedral interstitial between the iron atoms.

***S*:** Silicates.

These compounds were broken off from the *H* category in SB-II, and some of the compounds have both *H* and *S* labels:

- ***S*0:** Silicates with isolated SiO_4 tetrahedra and other anions.
- ***S*1:** Silicates with isolated $(SiO_4)_n$ tetrahedra, $n > 1$.
- ***S*2:** Silicates with connected groups of SiO_4 tetrahedra.

  In these compounds, the oxygen ions are shared between two tetrahedra.
- ***S*3:** Silicates with one-dimensional Si-O chains.
- ***S*4:** Silicates with two-dimensional Si-O networks.
- ***S*5:** Silicates with three-dimensional Si-O networks.
- ***S*6:** Other silicates.

5. Index of *Strukturbericht* symbols in the Prototype Encyclopedia

Here we list all of the "inorganic" (not beginning with *O*) *Strukturbericht* designations we have found in the literature, with a link to the corresponding web page in the Prototype Encyclopedia. Our primary source is the seven volumes of *Strukturbericht*, but we include designations from other sources as well.

The list has five columns:

SB: This is the *Strukturbericht* designation appearing in the literature. When a structure has multiple designations, we choose one of these, usually the latest, to be the primary designation. If the current designation is the primary one, it will appear in bold and italics, otherwise it will be in italics (unbolded).

In several cases, the literature did not give sufficient information to allow us to reconstruct the structure. In those cases the designation is in italics and there is no primary designation nor any page in the Prototype Encyclopedia.

Prototype: This is the chemical formula of the prototype for this *Strukturbericht* designation. When available, the common name for this structure is also listed here. In most cases we use the prototype from the source in the next column. When we use another prototype, this column will have two entries: the first is the compound we use as the prototype, and the second is the compound defined as the prototype in the literature.

In some cases, later experiments have shown that a structure defined in the literature is incorrect. We will still have a Prototype Encyclopedia entry for these structures, but they will be marked "obsolete." Here

we indicate an obsolete structure by listing the prototype in italics. If data for the currently accepted structure is available, there will be a link to it from the obsolete structure's Prototype Encyclopedia page.

Source: This is where we found the definition of the current *Strukturbericht* designation. The entry, or entries, consist of a label defining the source followed by the page number, where available. We use the following abbreviations:

SB-I – SB-VII: The original *Strukturbericht* volumes [36, 47, 49, 52–55].

Smi: *Smithells Metals Reference,* 2^{nd} *Edition* (1955) [8]. This is the source of forty-five designations not found in the original *Strukturbericht* series.

Per: *Pearson's Handbook of Lattice Spacings and Structures of Metals and Alloys* (1958) [5] adds ten more designations, and repeats some of Smithells's list. Pearson's list is repeated in later editions of the Handbook, but often not in an easily searchable form.

Per91: *Pearson's Handbook* (1991 edition) [10].

Gmelin: *Gmelin Handbook* (1993) [12].

Hart: G. L. W. Hart and coworkers (2009, 2010, 2011, 2013) [56–59].

This reference here is the source which defines the *Strukturbericht designation*. The source we used to obtain the actual crystal structure is given in the prototype's Encyclopedia entry.

Other SB: We list other *Strukturbericht* designations for the current structure, as well as their sources. If the designation in the SB column is not the primary one, the primary will be highlighted in bold here. These duplications occurred because of shifting definition of the main *Strukturbericht* categories in the first three volumes, but there were also several editorial errors, including missing *Strukturbericht* designations ($C20$) and multiple definitions of the $S3_3$ and $S3_4$ structures.

AFLOW: The AFLOW label for this structure. These are only the primary designations. In the online version of this article, clicking on the structure label will open the corresponding web page in the AFLOW Prototype Encyclopedia.

6. Future work

New structure-types are constantly being investigated for inclusion into the Prototype Encyclopedia. AFLOW's symmetry (AFLOW-SYM) [60] and crystal prototype finder (AFLOW-XtalFinder) [37] software modules are actively being employed to identify and classify prototypes from literature (*e.g.*, ICSD [61]). Unique prototypes — after comparing against those in Parts 1, 2, and 3 — will be added to future installments of the Prototype Encyclopedia. The symmetries of the prototypes (*i.e.*, Pearson symbol, space group, and Wyckoff positions) will be calculated autonomously and self-consistently via AFLOW-SYM [60]. AFLOW-XtalFinder will map structures into the degrees of freedom consistent with the International Tables for Crystallography, determine the AFLOW prototype label and parameters, and create geometry files for structures in this representation with a symbolic prototype generator [37].

7. User contributions

Online functionality has been developed to analyze the prototype of a user's input structure (http://aflow.org/prototype-encyclopedia/xtal-finder.html). The structure is automatically compared to all existing prototype entries via AFLOW-XtalFinder [37]. If a matching entry is found, the relevant prototype information is returned (*e.g.*, prototype label and parameters, *Strukturbericht* designation, symmetry descriptions, and weblink to the entry). If no matching entry is found — signaling a new prototype — users can report the structure by providing the following information in an online form: **i.** geometry file (in any standardized format), **ii.** reference(s) that reported the structure, **iii.** supplemental reference(s) used to find the structure (*e.g.*, catalogs or online databases), **iv.** any notable comments, and **v.** uploader's information (to credit the contributor on that structure's entry page, if desired). Unique prototype suggestions will be collected for future enrichment of the encyclopedia.

8. Outreach and education

AFLOW Schools (http://aflow.org/aflow-school/) provide learning modules to teach the theory of and provide hands-on examples for analyzing the structure of materials; including crystallographic symmetry, prototype classification, and structural similarity. Modules are also available for studying thermodynamics (polar and non-polar materials), accessing data in AFLOW.org (APIs), calculating thermomechanical properties, modeling disordered compounds, and predicting the properties of materials with machine learning.

9. Conclusion

This article presents the newest additions to the *AFLOW Library of Crystallographic Prototypes*, which now contains 1,100 entries. This includes all of the inorganic crystal structures that were given *Strukturbericht* designations in the original volumes or by references found in the literature. We also provide a brief history of the development of the *Strukturbericht* designations and the changes to the system over time.

Declaration of competing interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Acknowledgments

This work has been supported by DOD-ONR (N00014-15-1-2863, N00014-16-1-2326, N00014-17-1-2876, N00014-21-1-2132, N00014-21-1-2515) and NSF (DMR-1921909). David Hicks acknowledges support from the Department of Defense through the National Defense Science and Engineering Graduate (NDSEG) Fellowship Program. Michael Mehl would like to thank Lauren Mehl, Stephanie Mehl, and Gus Hart for the donation of several of the original *Strukturbericht* volumes as well as the Trotter and Bree cumulative index. The authors thank Eric Gossett, Demet Usanmaz, Andriy Smolyanyuk, Rico Friedrich, Frisco Rose, Yoav Lederer, Robert Hanson, Matthias Scheffler, Christian Carbogno, Paul Saxe, and Xiomara Campilongo for valuable discussions.

AFLOW prototype command	:	`aflow --proto=A12B2CD12_aP54_2_12i_2i_i_12i --params=`$a, b/a, c/a, \alpha, \beta, \gamma, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}, x_{18}, y_{18}, z_{18}, x_{19}, y_{19}, z_{19}, x_{20}, y_{20}, z_{20}, x_{21}, y_{21}, z_{21}, x_{22}, y_{22}, z_{22}, x_{23}, y_{23}, z_{23}, x_{24}, y_{24}, z_{24}, x_{25}, y_{25}, z_{25}, x_{26}, y_{26}, z_{26}, x_{27}, y_{27}, z_{27}$

- This is the accepted structure for $Ni(NO_3)_2(H_2O)_6$, replacing the $H6_4$ structure. The positions of the hydrogen atoms are approximate.

Triclinic primitive vectors:

$$\mathbf{a}_1 = a\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\cos\gamma\,\hat{\mathbf{x}} + b\sin\gamma\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c_x\hat{\mathbf{x}} + c_y\,\hat{\mathbf{y}} + c_z\,\hat{\mathbf{z}}$$

$$c_x = c\cos\beta$$
$$c_y = c\,(\cos\alpha - \cos\beta\cos\gamma)/\sin\gamma$$
$$c_z = \sqrt{c^2 - c_x^2 - c_y^2}$$

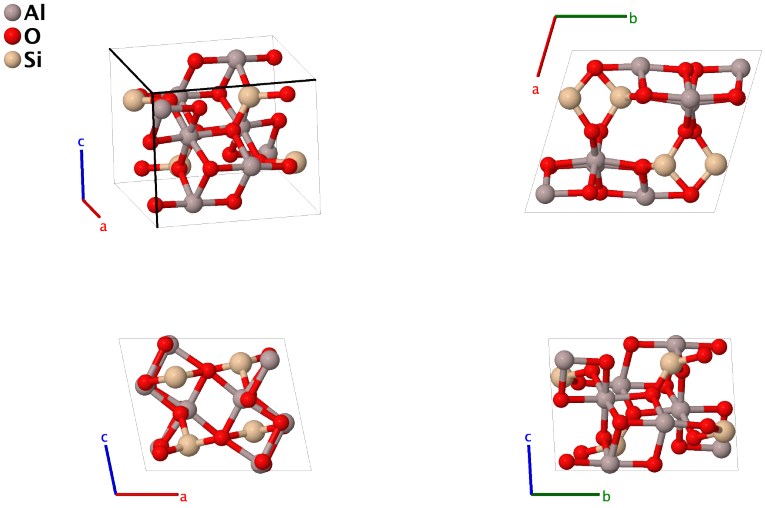
Kyanite (Al_2SiO_5, $S0_1$) Structure: A2B5C_aP32_2_4i_10i_2i

http://aflow.org/prototype-encyclopedia/A2B5C_aP32_2_4i_10i_2i



Prototype	:	Al_2O_5Si
AFLOW prototype label	:	A2B5C_aP32_2_4i_10i_2i
***Strukturbericht* designation**	:	$S0_1$
Pearson symbol	:	aP32
Space group number	:	2
Space group symbol	:	$P\bar{1}$
AFLOW prototype command	:	`aflow --proto=A2B5C_aP32_2_4i_10i_2i --params=`$a, b/a, c/a, \alpha, \beta, \gamma, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}$

- Three crystal polymorphs of Al_2SiO_5 have been characterized: kyanite ($S0_1$), space group $P\bar{1}$ #2, andalusite ($S0_2$), space group *Pnnm* #58, and sillimanite ($S0_3$), space group *Pnma* #62. All are characterized by chains of edge-sharing SiO_6 tetrahedra and Al octahedra.
- (Ewald, 1931) originally gave Kyanite the $H5_1$ *Strukturbericht* symbol, but this was changed to $S0_1$ in (Hermann, 1937).
- We use the ambient pressure data of (Yang, 1997).

Triclinic primitive vectors:

$$\mathbf{a}_1 = a\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\cos\gamma\,\hat{\mathbf{x}} + b\sin\gamma\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c_x\hat{\mathbf{x}} + c_y\,\hat{\mathbf{y}} + c_z\,\hat{\mathbf{z}}$$

$$c_x = c\,\cos\beta$$
$$c_y = c\,(\cos\alpha - \cos\beta\cos\gamma)/\sin\gamma$$
$$c_z = \sqrt{c^2 - c_x^2 - c_y^2}$$

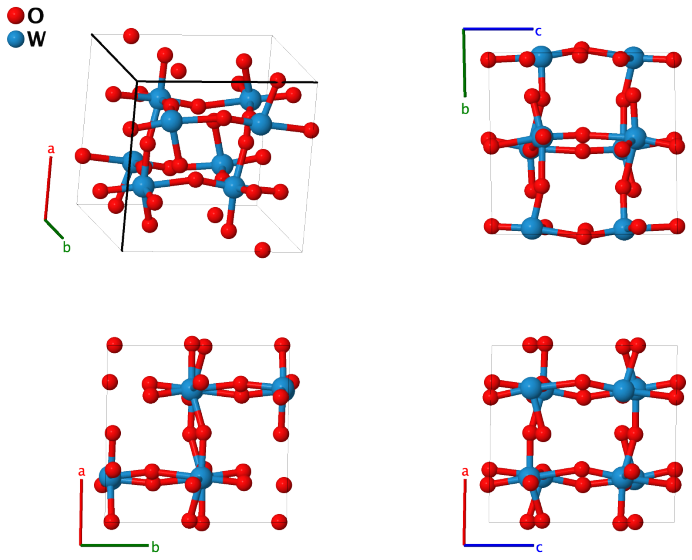
δ-WO_3 Structure: A3B_aP32_2_12i_4i

http://aflow.org/prototype-encyclopedia/A3B_aP32_2_12i_4i



Prototype	:	O_3W
AFLOW prototype label	:	A3B_aP32_2_12i_4i
***Strukturbericht* designation**	:	None
Pearson symbol	:	aP32
Space group number	:	2
Space group symbol	:	$P\bar{1}$
AFLOW prototype command	:	`aflow --proto=A3B_aP32_2_12i_4i --params=`$a, b/a, c/a, \alpha, \beta, \gamma, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}$

- All stable phases of WO_3 are distortions of the cubic α-ReO_3 ($D0_9$) phase. Based on (Woodward, 1997 and Vogt, 1999), the known stable phases and their approximate temperature ranges are:
  - α-WO_3 (1010-1170K) (Vogt, 1999)
  - β-WO_3 (600-1170K) (Vogt, 1999)
  - γ-WO_3 (290-600K) (Vogt, 1999)
  - δ-WO_3 (230-290K) (Diehl, 1978), this structure
  - ϵ-WO_3 (below 23K) (Woodward, 1997)

  Woodward's caption says "The transition temperatures display large hysteresis effects and universal agreement is not found in the literature."
- In addition, several other structures have been proposed and/or found:
  - The original $D0_{10}$ structure (Bräkken, 1931), (Hermann, 1937) superseded by δ-WO_3
  - Original β-WO_3 (Salje, 1977)
  - Hexagonal WO_3 (Gerand, 1979) (metastable)

Triclinic primitive vectors:

$$\begin{aligned}
\mathbf{a}_1 &= a\hat{\mathbf{x}} \\
\mathbf{a}_2 &= b\cos\gamma\,\hat{\mathbf{x}} + b\sin\gamma\,\hat{\mathbf{y}} \\
\mathbf{a}_3 &= c_x\hat{\mathbf{x}} + c_y\,\hat{\mathbf{y}} + c_z\,\hat{\mathbf{z}}
\end{aligned}$$

$$\begin{aligned}
c_x &= c\,\cos\beta \\
c_y &= c\,(\cos\alpha - \cos\beta\cos\gamma)/\sin\gamma \\
c_z &= \sqrt{c^2 - c_x^2 - c_y^2}
\end{aligned}$$

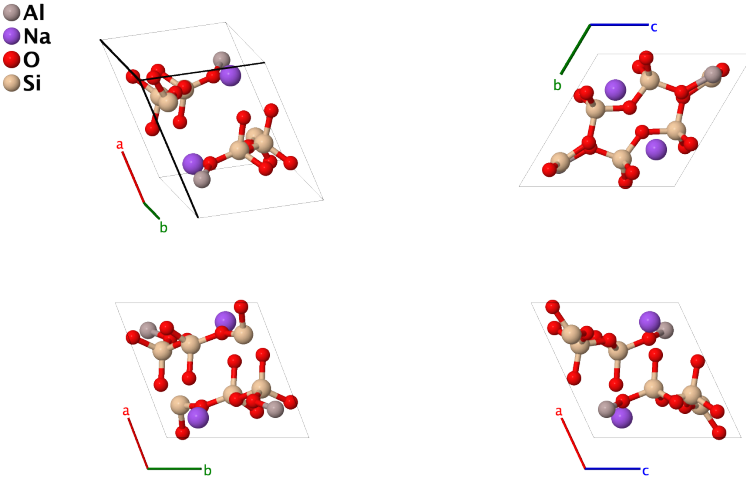
Albite ($NaAlSi_3O_8$, $S6_8$) Structure: ABC8D3_aP26_2_i_i_8i_3i

http://aflow.org/prototype-encyclopedia/ABC8D3_aP26_2_i_i_8i_3i



Prototype	:	$AlNaO_8Si_3$
AFLOW prototype label	:	ABC8D3_aP26_2_i_i_8i_3i
***Strukturbericht* designation**	:	$S6_8$
Pearson symbol	:	aP26
Space group number	:	2
Space group symbol	:	$P\bar{1}$
AFLOW prototype command	:	`aflow --proto=ABC8D3_aP26_2_i_i_8i_3i --params=`$a, b/a, c/a, \alpha, \beta, \gamma, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}$

- We used the 13 K data from (Smith, 1986), however they present their data in space group $C\bar{1}$, which doubles the primitive unit cell compared to the standard space group $P\bar{1}$ #2. We used FINDSYM to convert from the presented cell to the conventional cell. This involved a rotation of the cell, *e.g.*, the original c axis is the a axis in our standard primitive cell.
- Technically this is "low" albite. In high albite the silicon and aluminum atoms are mixed over all four sites, as in sandine ($S6_7$). Indeed, under some conditions albite crystals are seen in the sandine structure (Winter, 1979). See the albite entry in (Downs, 2003) for other experimental work.

Triclinic primitive vectors:

$$\begin{aligned}
\mathbf{a}_1 &= a\hat{\mathbf{x}} \\
\mathbf{a}_2 &= b\cos\gamma\,\hat{\mathbf{x}} + b\sin\gamma\,\hat{\mathbf{y}} \\
\mathbf{a}_3 &= c_x\hat{\mathbf{x}} + c_y\,\hat{\mathbf{y}} + c_z\,\hat{\mathbf{z}}
\end{aligned}$$

$$\begin{aligned}
c_x &= c\,\cos\beta \\
c_y &= c\,(\cos\alpha - \cos\beta\cos\gamma)/\sin\gamma \\
c_z &= \sqrt{c^2 - c_x^2 - c_y^2}
\end{aligned}$$

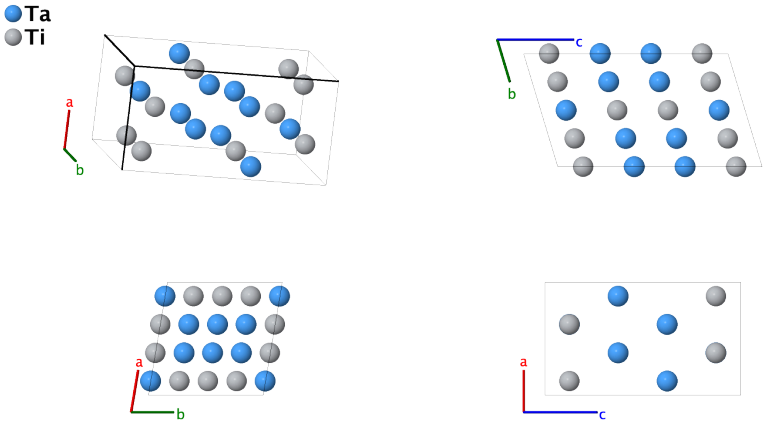
TaTi (BCC SQS-16) Structure: AB_aP16_2_4i_4i

http://aflow.org/prototype-encyclopedia/AB_aP16_2_4i_4i



Prototype	:	TaTi
AFLOW prototype label	:	AB_aP16_2_4i_4i
***Strukturbericht* designation**	:	None
Pearson symbol	:	aP16
Space group number	:	2
Space group symbol	:	$P\bar{1}$
AFLOW prototype command	:	`aflow --proto=AB_aP16_2_4i_4i --params=`$a, b/a, c/a, \alpha, \beta, \gamma, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- This is a special quasirandom structure with 16 atoms per unit cell (SQS-16) for a bcc binary substitutional alloy A_xB_{1-x} (Jiang, 2004). This prototype is the equicompositional structure ($x = 0.5$). The $x = 0.25$ and $x = 0.75$ structures are given by AB3_mC32_8_4a_12a.

Triclinic primitive vectors:

$$\mathbf{a}_1 = a\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\cos\gamma\,\hat{\mathbf{x}} + b\sin\gamma\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c_x\hat{\mathbf{x}} + c_y\,\hat{\mathbf{y}} + c_z\,\hat{\mathbf{z}}$$

$$c_x = c\cos\beta$$
$$c_y = c\left(\cos\alpha - \cos\beta\cos\gamma\right)/\sin\gamma$$
$$c_z = \sqrt{c^2 - c_x^2 - c_y^2}$$

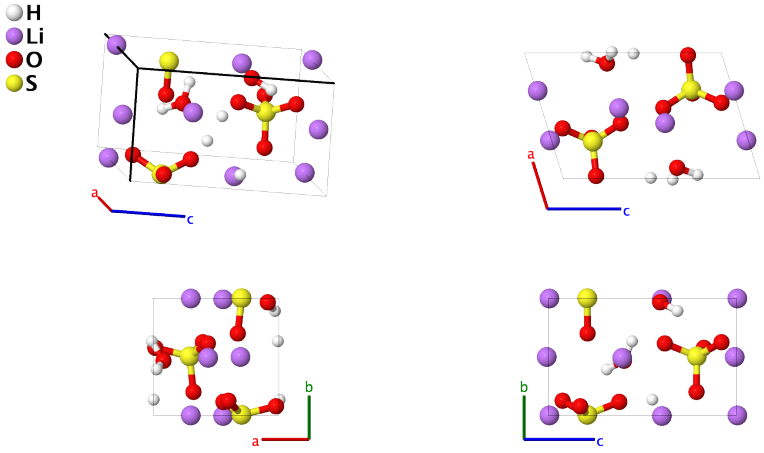
$Li_2SO_4{\cdot}H_2O$ ($H4_8$) Structure: A2B2C5D_mP20_4_2a_2a_5a_a

http://aflow.org/prototype-encyclopedia/A2B2C5D_mP20_4_2a_2a_5a_a



Prototype	:	$H_2Li_2O_5S$
AFLOW prototype label	:	A2B2C5D_mP20_4_2a_2a_5a_a
***Strukturbericht* designation**	:	$H4_8$
Pearson symbol	:	mP20
Space group number	:	4
Space group symbol	:	$P2_1$
AFLOW prototype command	:	`aflow --proto=A2B2C5D_mP20_4_2a_2a_5a_a --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}$

- We use the data from (Lundgren, 1984) at 20 K, including the positions of the hydrogen atoms not found in the original $H4_8$ structure in (Gottfried, 1937).
- Space group $P2_1$ #4 allows the y coordinates to have an arbitrary origin. We follow (Lundgren, 1984) and set the y coordinate of the sulfur atom, y_{10}, to zero.

AFLOW prototype label	:	A2B2C9D2_mC90_5_ab2c_3c_b13c_3c
***Strukturbericht* designation**	:	$H4_7$
Pearson symbol	:	mC90
Space group number	:	5
Space group symbol	:	$C2$
AFLOW prototype command	:	`aflow --proto=A2B2C9D2_mC90_5_ab2c_3c_b13c_3c --params=`$a, b/a, c/a, \beta, y_1, y_2, y_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}, x_{18}, y_{18}, z_{18}, x_{19}, y_{19}, z_{19}, x_{20}, y_{20}, z_{20}, x_{21}, y_{21}, z_{21}, x_{22}, y_{22}, z_{22}, x_{23}, y_{23}, z_{23}, x_{24}, y_{24}, z_{24}$

- (Gottfried, 1937) gave this the *Strukturbericht* designation $H4_7$. They listed the system as monoclinic, with space group $C2$ #5, but noted that it was pseudo-hexagonal and gave the coordinates for all of the atoms except the water molecules in terms of the trigonal space group $P3_121$ #152. (Abriel, 1993) found a complete determination of the structure, in space group $I2$ #5, which we have converted to the standard $C2$ setting. The exact structure of this system seems to depend on the actual amount of water and the preparation mechanism (Singh, 2007).
- The $P3_121$ structure can be obtained from these positions by removing all of the water molecules (the hydrogen atoms plus O-I and O-XIV), and allowing for a small uncertainty in the positions of the remaining atoms.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

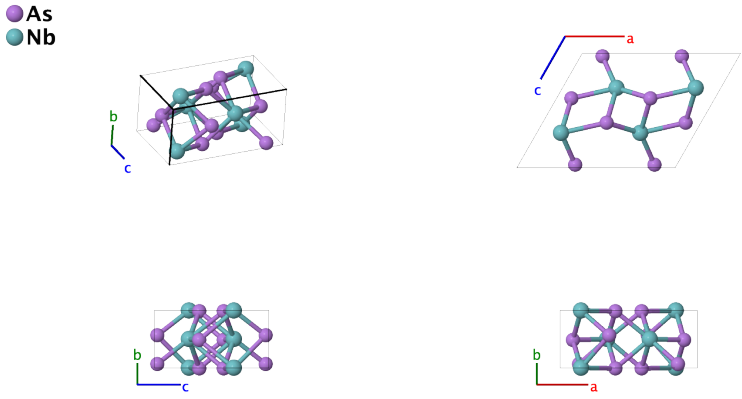
$NbAs_2$ Structure: A2B_mC12_5_2c_c

http://aflow.org/prototype-encyclopedia/A2B_mC12_5_2c_c



Prototype	:	As_2Nb
AFLOW prototype label	:	A2B_mC12_5_2c_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC12
Space group number	:	5
Space group symbol	:	$C2$
AFLOW prototype command	:	`aflow --proto=A2B_mC12_5_2c_c --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3$

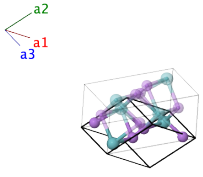
Other compounds with this structure

- $MoAs_2$, $TaAs_2$, $NbSb_2$, and $TaSb_2$

- The zero of the y-axis can be chosen arbitrarily in space group $C2$ #5. Here we chose it so that $y_3 = 1/2$ for the niobium atom.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

	Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	$= (x_1 - y_1)\,\mathbf{a}_1 + (x_1 + y_1)\,\mathbf{a}_2 + z_1\,\mathbf{a}_3$	$=$	$(x_1 a + z_1 c\cos\beta)\,\hat{\mathbf{x}} + y_1 b\,\hat{\mathbf{y}} + z_1 c\sin\beta\,\hat{\mathbf{z}}$	$(4c)$	As I
$\mathbf{B}_2$	$= (-x_1 - y_1)\,\mathbf{a}_1 + (-x_1 + y_1)\,\mathbf{a}_2 - z_1\,\mathbf{a}_3$	$=$	$(-x_1 a - z_1 c\cos\beta)\,\hat{\mathbf{x}} + y_1 b\,\hat{\mathbf{y}} - z_1 c\sin\beta\,\hat{\mathbf{z}}$	$(4c)$	As I

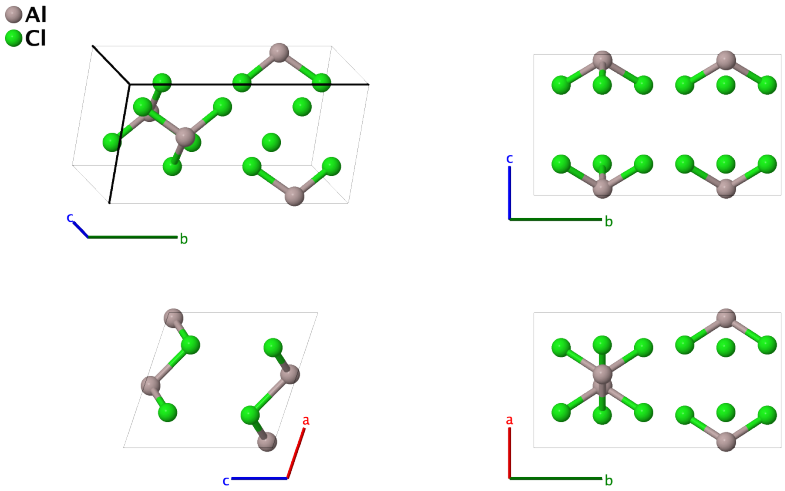
$D0_{15}$ ($AlCl_3$) (*obsolete*) Structure: AB3_mC16_5_c_3c

http://aflow.org/prototype-encyclopedia/AB3_mC16_5_c_3c

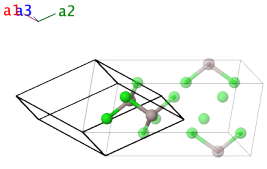


Prototype	:	$AlCl_3$
AFLOW prototype label	:	AB3_mC16_5_c_3c
***Strukturbericht* designation**	:	$D0_{15}$
Pearson symbol	:	mC16
Space group number	:	5
Space group symbol	:	$C2$
AFLOW prototype command	:	`aflow --proto=AB3_mC16_5_c_3c --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4$

- This structure was suggested by (Ketelaar, 1935) and given the *Strukturbericht* designation $D0_{15}$ by (Gottfried, 1395) with no reference to the $D0_{13}$ structure of (Laschkarew, 1930) found in (Hermann, 1937).
- Ketelaar gave a description of the unit cell a hexagonal setting, but the atomic positions resolve into the body-centered monoclinic cell shown here. This structure, however, has a lower symmetry than the currently accepted structure, which is body-centered monoclinic, space group $C2/m$ #12. We had previously designated that structure $D0_{15}$, but the current structure was given that designation by (Hermann, 1937).

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

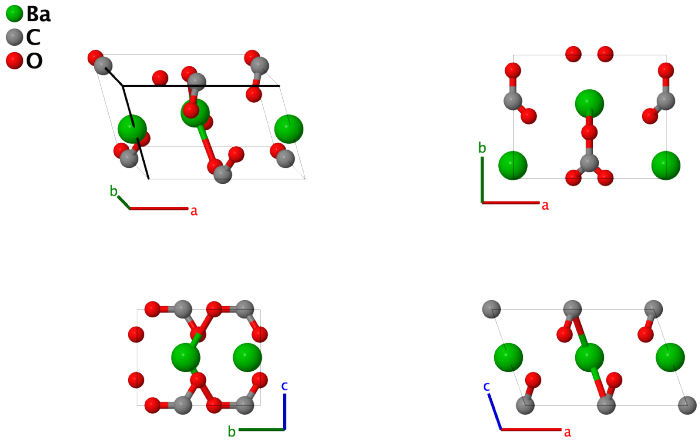
$C2$ (Ba,Ca)CO_3 Structure: ABC3_mC10_5_b_a_ac

http://aflow.org/prototype-encyclopedia/ABC3_mC10_5_b_a_ac

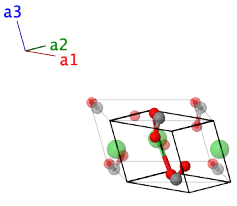


Prototype	:	(Ba,Ca)CO_3
AFLOW prototype label	:	ABC3_mC10_5_b_a_ac
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC10
Space group number	:	5
Space group symbol	:	$C2$
AFLOW prototype command	:	`aflow --proto=ABC3_mC10_5_b_a_ac --params=`$a, b/a, c/a, \beta, y_1, y_2, y_3, x_4, y_4, z_4$

- (Ba,Ca)$(CO_3)_2$ comes in a variety of crystal structures (Spahr, 2019):
  - monoclinic barytocalcite, space group $P2_1/m$ #11 (the current structure).
  - trigonal paralstonite, space group $P321$ #150,
  - Triclinic alstonite, space group $P1$ #1 or $P\bar{1}$ #2 (Sartori, 1975), and
  - a new monoclinic structure, space group $C2$ #5, synthesized by (Spahr, 2019), and lacking the centrosymmetric character of barytocalcite.
- The site we have labeled Ba is actually a mixture of barium and calcium atoms.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

- Although this structure was formed at 1300 °C, the data was taken after cooling to room temperature, 295 K.
- The true composition of the Ca-I site is $Ca_{0.84}Na_{0.16}$, and the Na-I site has composition $Na_{0.84}Ca_{0.16}$.
- The Si-III and Si-IV atoms share the O-*X* atom between them, accounting for the "missing" oxygen atom.

***Strukturbericht* designation**	:	None
Pearson symbol	:	mC102
Space group number	:	8
Space group symbol	:	*Cm*
AFLOW prototype command	:	`aflow --proto=A13B4_mC102_8_17a11b_8a2b --params=`$a, b/a, c/a, \beta, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, z_7, x_8, z_8, x_9, z_9, x_{10}, z_{10}, x_{11}, z_{11}, x_{12}, z_{12}, x_{13}, z_{13}, x_{14}, z_{14}, x_{15}, z_{15}, x_{16}, z_{16}, x_{17}, z_{17}, x_{18}, z_{18}, x_{19}, z_{19}, x_{20}, z_{20}, x_{21}, z_{21}, x_{22}, z_{22}, x_{23}, z_{23}, x_{24}, z_{24}, x_{25}, z_{25}, x_{26}, y_{26}, z_{26}, x_{27}, y_{27}, z_{27}, x_{28}, y_{28}, z_{28}, x_{29}, y_{29}, z_{29}, x_{30}, y_{30}, z_{30}, x_{31}, y_{31}, z_{31}, x_{32}, y_{32}, z_{32}, x_{33}, y_{33}, z_{33}, x_{34}, y_{34}, z_{34}, x_{35}, y_{35}, z_{35}, x_{36}, y_{36}, z_{36}, x_{37}, y_{37}, z_{37}, x_{38}, y_{38}, z_{38}$

- Following (Hudd, 1962), the Al-IV and Al-XIII sites are occupied 30% of the time, while the occupation of Al-VI, Al-IX, Al-XIV, and Al-XVII is 70%. This gives a nominial occupation of $Al_{91}Co_{30}$, though the authors state the actual composition is $Al_{68.3}Co_{24.4}$.
- Space group *Cm* #8 allows an arbitrary choice for the origin of the z-axis. We follow (Hudd, 1962) and set the $z_{26} = 0$.
- AFLOW-SYM yields space group *Cm* #8 consistently for small and large tolerances. However, if we allow a rather large uncertainty of 0.3 Å in the atomic positions with FINDSYM, the symmetry is set as $C2/m$ #12. That crystal has the $Al_{13}Fe_4$ prototype.

Base-centered Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

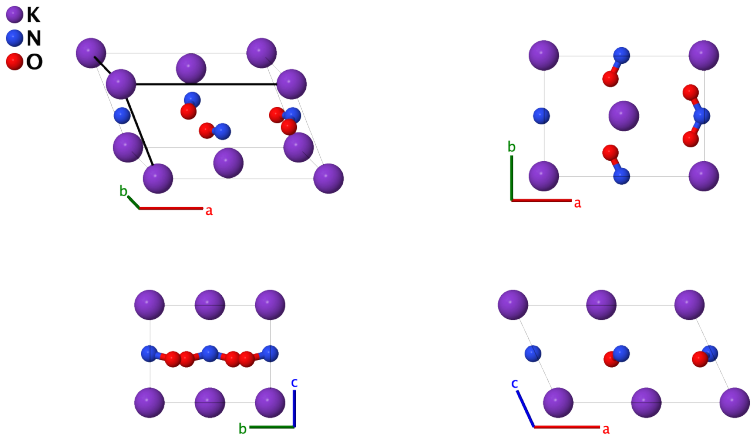
$F5_{11}$ (KNO_2) (*obsolete*) Structure: ABC2_mC8_8_a_a_b

http://aflow.org/prototype-encyclopedia/ABC2_mC8_8_a_a_b

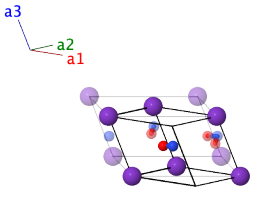


Prototype	:	KNO_2
AFLOW prototype label	:	ABC2_mC8_8_a_a_b
***Strukturbericht* designation**	:	$F5_{11}$
Pearson symbol	:	mC8
Space group number	:	8
Space group symbol	:	*Cm*
AFLOW prototype command	:	`aflow --proto=ABC2_mC8_8_a_a_b --params=`$a, b/a, c/a, \beta, x_1, z_1, x_2, z_2, x_3, y_3, z_3$

- "The room-temperature structure of KNO_2 was first considered to have monoclinic symmetry, ..., but recent studies have established the structure to be rhombohedral ..." (Rao, 1975). The $F5_{11}$ structure is thus neither the ground state structure of KNO_2 nor the room-temperature structure, which is somewhat disordered with space group $R\bar{3}m$. We present this structure as part of the historical record.
- (Ziegler, 1936) gave this structure in the *Am* setting of space group #8. We used FINDSYM to transform it to the standard *Cm* setting, which involved a considerable change in the orientation and length of the primitive lattice vectors.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

	Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$ =	$x_1\,\mathbf{a}_1 + x_1\,\mathbf{a}_2 + z_1\,\mathbf{a}_3$	=	$(x_1 a + z_1 c\cos\beta)\,\hat{\mathbf{x}} + z_1 c\sin\beta\,\hat{\mathbf{z}}$	$(2a)$	K

$$\mathbf{B}_2 = x_2\,\mathbf{a}_1 + x_2\,\mathbf{a}_2 + z_2\,\mathbf{a}_3 = (x_2 a + z_2 c\cos\beta)\,\hat{\mathbf{x}} + z_2 c\sin\beta\,\hat{\mathbf{z}} \quad (2a) \quad \text{N}$$

$$\mathbf{B}_3 = (x_3 - y_3)\,\mathbf{a}_1 + (x_3 + y_3)\,\mathbf{a}_2 + z_3\,\mathbf{a}_3 = (x_3 a + z_3 c\cos\beta)\,\hat{\mathbf{x}} + y_3 b\,\hat{\mathbf{y}} + z_3 c\sin\beta\,\hat{\mathbf{z}} \quad (4b) \quad \text{O}$$

$$\mathbf{B}_4 = (x_3 + y_3)\,\mathbf{a}_1 + (x_3 - y_3)\,\mathbf{a}_2 + z_3\,\mathbf{a}_3 = (x_3 a + z_3 c\cos\beta)\,\hat{\mathbf{x}} - y_3 b\,\hat{\mathbf{y}} + z_3 c\sin\beta\,\hat{\mathbf{z}} \quad (4b) \quad \text{O}$$

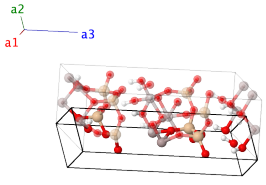
- (Herrmann, 1943) gave the nacrite structure determined by (Hendricks, 1939) the *Strukturbericht* symbol $S5_4$. This structure was somewhat uncertain, as Hendricks knew that the structure had space group Cc but could only determine the structure in terms of a pseudo-rhombohedral unit cell. This led to a tripling of the unit cell compared to the work of (Zhukhlistov, 2008), who was also able to determine the positions of the hydrogen atoms. We use the modern structure, noting that we can essentially recover the original structure by tripling the unit cell along the c-axis.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

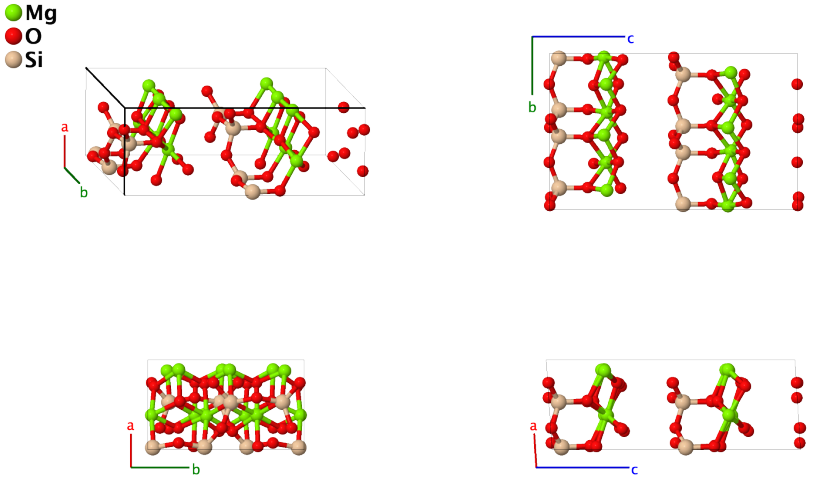
Chrysotile ($Mg_3Si_2O_5(OH)_4$) Structure: A3B5C4D2_mC56_9_3a_5a_4a_2a

http://aflow.org/prototype-encyclopedia/A3B5C4D2_mC56_9_3a_5a_4a_2a



Prototype	:	$Mg_3O_5(OH)_4Si_2$
AFLOW prototype label	:	A3B5C4D2_mC56_9_3a_5a_4a_2a
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC56
Space group number	:	9
Space group symbol	:	Cc
AFLOW prototype command	:	`aflow --proto=A3B5C4D2_mC56_9_3a_5a_4a_2a --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}$

- Chrysotile is more commonly known as "white asbestos." Chrysotile sheets typically curl into tubular fibers and the crystal structure is difficult to determine. (Yada, 1967) has a partial list of the experiments performed to determine this structure. This differs from the early work of (Warren, 1930), $S4_5$, which halves the size of the unit cell and removes the inversion site. For this prototype, the OH molecules are centered on four a Wyckoff positions.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

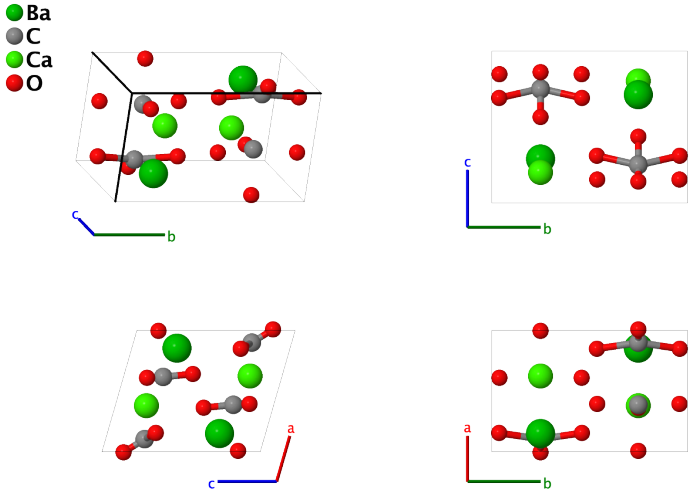
Barytocalcite ($BaCa(CO_3)_2$) Structure: AB2CD6_mP20_11_e_2e_e_2e2f

http://aflow.org/prototype-encyclopedia/AB2CD6_mP20_11_e_2e_e_2e2f

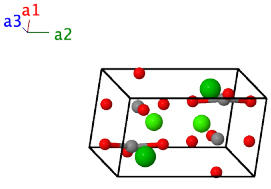


Prototype	:	BaC_2CaO_6
AFLOW prototype label	:	AB2CD6_mP20_11_e_2e_e_2e2f
***Strukturbericht* designation**	:	None
Pearson symbol	:	mP20
Space group number	:	11
Space group symbol	:	$P2_1/m$
AFLOW prototype command	:	`aflow --proto=AB2CD6_mP20_11_e_2e_e_2e2f --params=`$a, b/a, c/a, \beta, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- $BaCa(CO_3)_2$ comes in a variety of crystal structures (Spahr, 2019):
  - monoclinic barytocalcite, space group $P2_1/m$ #11 (the current structure)
  - trigonal paralstonite, space group $P321$ #150,
  - Triclinic alstonite, space group $P1$ #1 or $P\bar{1}$ #2 (Sartori, 1975), and
  - a new monoclinic structure, space group $C2$ #5, synthesized by (Spahr, 2019), and lacking the centrosymmetric character of barytocalcite.

Simple Monoclinic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

Other compounds with this structure

- $MgBr_2{\cdot}6H_2O$

- This structure is nearly identical to the one presented in (Gottfried, 1937) as $J1_7$, but now includes the positions of the hydrogen atoms.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$

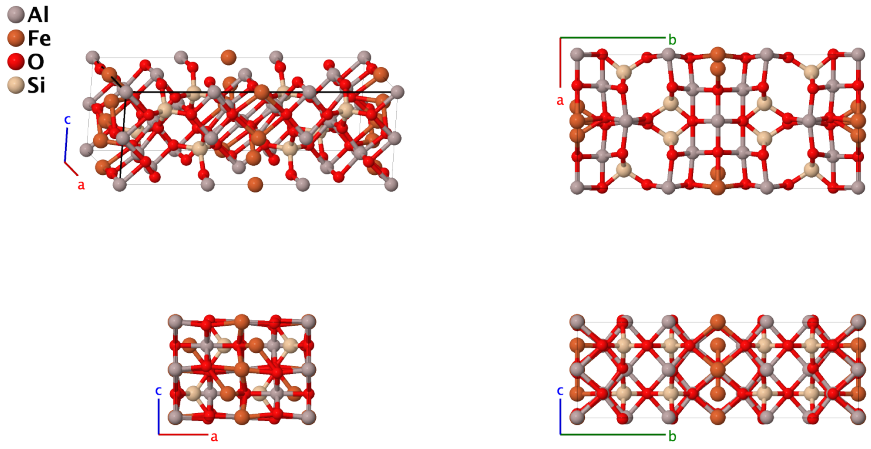
Staurolite ($Al_5Fe_2O_{10}(OH)_2Si_2$) Structure: A5B2C10D2E2_mC84_12_acghj_bdi_5j_2i_j

http://aflow.org/prototype-encyclopedia/A5B2C10D2E2_mC84_12_acghj_bdi_5j_2i_j



Prototype	:	$Al_5Fe_2O_{10}(OH)_2Si_2$
AFLOW prototype label	:	A5B2C10D2E2_mC84_12_acghj_bdi_5j_2i_j
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC84
Space group number	:	12
Space group symbol	:	$C2/m$
AFLOW prototype command	:	`aflow --proto=A5B2C10D2E2_mC84_12_acghj_bdi_5j_2i_j --params=`$a, b/a, c/a, \beta, y_5, y_6, x_7, z_7, x_8, z_8, x_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}$

- The orthorhombic structure of staurolite determined by (Náray-Szabó, 1929) was given the *Strukturbericht* designation $S0_4$ by (Hermann, 1937). (Smith, 1968) showed that the structure is actually monoclinic with $\beta \approx 90°$, rather than orthorhombic. This paper also corrected the chemical composition of the mineral.
- The hydrogen positions are undetermined, but they are part of a "complex distribution of OH ions," and are "probably" associated with the atoms on the (4*i*) sites (Smith, 1968). We therefore label the (4*i*) sites as OH.
- The metallic sites are actually somewhat disordered. (Smith, 1968) gives the composition of the various sites as
  - Al (2*a*) $Al_{0.67}$ $Fe_{0.33}$
  - Fe (2*b*) $Fe_{0.68}$ $Mn_{0.32}$
  - Al (2*c*) $Al_{0.67}$ $Fe_{0.33}$
  - Fe (2*d*) $Fe_{0.68}$ $Mn_{0.32}$
  - Al (4*g*) $Al_{0.95}$ $Mg_{0.05}$
  - Al (4*h*) $Al_{0.95}$ $Mg_{0.05}$
  - Fe (4*i*) $Fe_{0.64}$ $Al_{0.32}$ $Ti_{0.04}$
  - Si (8*j*) $Si_{0.936}$ $Al_{0.064}$
- (Donnay, 1983) presents a history of the difficulties in determining the staurolite structure.

Base-centered Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

- Properly, the prototype of leonite is $K_2Mg(SO_4)_2{\cdot}4H_2O$, but (Herrmann, 1943) gives manganese-leonite *Strukturbericht* symbol $H4_{23}$, so we will use Mn-leonite as the prototype.
- The room temperature leonite structure, shown here, is in space group $C2/m$ #12. It is characterized by the disorder of the second sulfate group, centered on atom S-II (Hertweck, 2001). The oxygen sites around S-II, labeled O-VII, O-VIII, and O-IX in our notation, are only occupied 50% of the time. (Anspach, 1939), who did the original determination of this structure, was not able to see the disorder, and so gives an ordered structure for both sulfates.

- We use the structure determined by (Hertweck, 2001) at room temperature, 293 K. At lower temperatures, the leonites undergo phase transitions. The exact transition temperature depends on the compound.
- At somewhat lower than room temperature (205 K for Mn-leonite) the sulfate group orders, doubling the size of the unit cell and changing the space group from $C2/m$ to $C2/c$ #15. At still lower temperatures (168 K for Mn-leonite) further ordering takes place and the structure transforms into the $P2_1/c$ #14 space group.

Base-centered Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

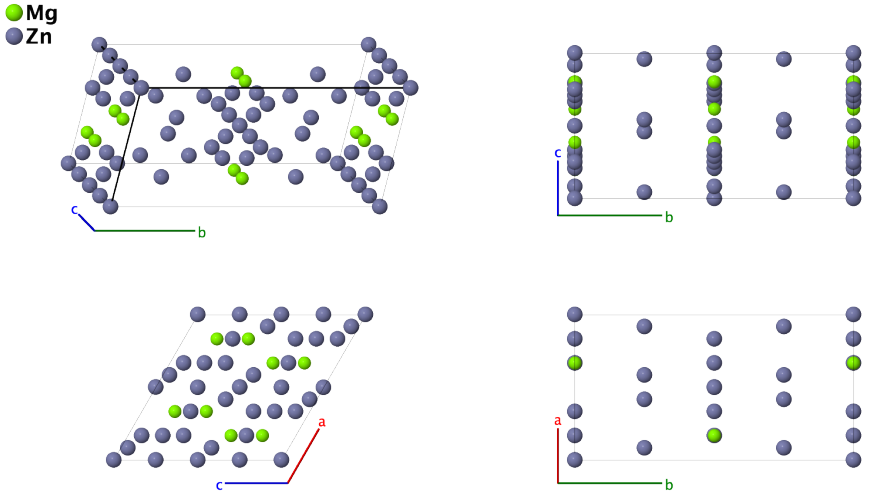
$D2_2$ ($MgZn_5$?) (*problematic*) Structure: AB5_mC48_12_2i_ac5i2j

http://aflow.org/prototype-encyclopedia/AB5_mC48_12_2i_ac5i2j



Prototype	:	$MgZn_5$
AFLOW prototype label	:	AB5_mC48_12_2i_ac5i2j
***Strukturbericht* designation**	:	$D2_2$
Pearson symbol	:	mC48
Space group number	:	12
Space group symbol	:	$C2/m$
AFLOW prototype command	:	`aflow --proto=AB5_mC48_12_2i_ac5i2j --params=`$a, b/a, c/a, \beta, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, z_7, x_8, z_8, x_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}$

- This structure has problems similar to the *B*30 MgZn structure, and for the same reasons. (Hermann, 1937) assigned this the *Strukturbericht* designation $D2_2$, based on the paper of (Tarschish, 1933), who derived it from the hexagonal Laves structure $MgZn_2$ (C14), eventually resulting in a 48 atom cell with composition $MgZn_5$. As with MgZn, he assumed that the space group remained $P6_3/mmc$ #194.
- (McKeehan, 1935) again pointed out that this is impossible. (Hermann, 1937) referenced both papers, giving the space group as $P6_3/mmc$ but listing the atomic coordinates enumerated by McKeehan.
- The McKeehan structure has space group $C2/m$ #12, with 48 atoms in the conventional cell, and 24 atoms in the primitive cell. As with *B*30, this agrees with the structure (Parthé, 1993) designate as $D2_2$.
- It is not clear that any $MgZn_5$ compound actually exists. It does not appear in the assessed Mg-Zn binary phase diagram (Massalski, 1990). It *may* actually be the Mg_2Zn_{11} $D8_c$ structure, but we have found no literature supporting this claim.

Base-centered Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

***Strukturbericht* designation**	:	$S4_5$
Pearson symbol	:	mC112
Space group number	:	12
Space group symbol	:	$C2/m$
AFLOW prototype command	:	`aflow --proto=AB6C11D6E4_mC112_12_e_gi2j_i5j_2i2j_2j --params=`$a, b/a, c/a, \beta, y_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}$

- Chrysotile is more commonly known as "white asbestos." Chrysotile sheets typically curl into tubular fibers and the crystal structure is difficult to determine. (Yada, 1967) has a partial list of the experiments performed to determine this structure. The current structure was given the *Strukturbericht* designation $S4_5$ by (Hermann, 1937). It doubles the unit cell of our other chrysotile structure, by (Falini, 2004) and includes an inversion site.
- The structure was originally given in the $I2/m$ setting of space group #12. We used FINDSYM to place it in the standard $C2/m$ setting.

Other compounds with this structure

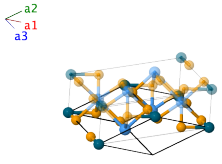
- Nb_2PdS_6, Nb_2PdSe_6, and Ta_2PdS_6

- (Keszler, 1985) gave the structure in the $I2/m$ setting of space group #12. We used FINDSYM to change this to the standard $C2/m$ setting. Because of this change, our primitive vectors are linear combinations of the original ones, and the lattice has been rotated.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

	Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$ =	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	$(2a)$	Pd

Other compounds with this structure

- $NaAlSi_3O_8$ and $(BaKNa)AlSi_3O_8$ (orthoclase)

- Begining with the $S6_7$ defining paper of (Taylor, 1933), all researchers agree that the sites Si-I and Si-II are actually a random mixture of silicon and aluminum with overall stoichiometry $AlSi_3$. Most results found in (Downs, 2003) assume that this composition holds independently for both sites, but (Scambos, 1987) states that the Si-I site is $Al_{1.064}Si_{2.936}$ while the Si-II site is $Al_{0.936}Si_{3.064}$.
- (Scambos, 1987) list the coordinate $y_8 = 0.18813$ for the Si-II site in Table 2. This position does not result in the expected SiO_4 tetrahedra, and the interatomic distances and angles found do not agree with their Table 5. (Downs, 2003) correct this to $y_8 = 0.11813$, and this value results in good tetrahedra and reproduces the distances and angles reported by (Scambos, 1987). We use this later value on this page.

Base-centered Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

- (Ardit, 2012) looked at samples with obvious disordering on the sites we label Al and Nb. For their sample N00, the occupation of our Al site was 80% aluminum and 20% niobium, with the reverse concentrations on our Nb site.
- (Pederson, 1962) analyzed a sample of $AlNbO_4$ assuming that these sites were fully ordered, however the atomic positions listed there have some errors, so we used the data found by Ardit *et al.*
- The atomic positions for this structure are not found in the main text. They are filed as item #AM-12-035 in the American Mineralogist repository.

Base-centered Monoclinic primitive vectors:

Other compounds with this structure

- GaTe and GeAs

- The structures of GaTe and GeAs were apparently determined by (Bryden, 1965) before (Wadsten, 1965) found the structure of SiAs, but they were never published (Pearson, 1964; Wadsten, 1965; Mead, 1982). As SiAs was the first published determination of this structure, we use it as the prototype.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$

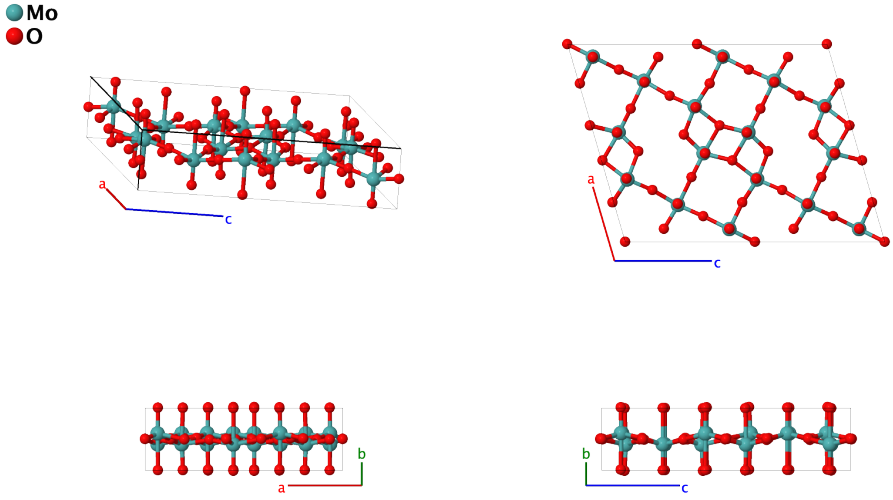
High-Temperature Mo_8O_{23} Structure: A8B23_mP62_13_4g_c11g

http://aflow.org/prototype-encyclopedia/A8B23_mP62_13_4g_c11g



Prototype	:	Mo_8O_{23}
AFLOW prototype label	:	A8B23_mP62_13_4g_c11g
***Strukturbericht* designation**	:	None
Pearson symbol	:	mP62
Space group number	:	13
Space group symbol	:	$P2/c$
AFLOW prototype command	:	`aflow --proto=A8B23_mP62_13_4g_c11g --params=`$a, b/a, c/a, \beta, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}$

- Above 285 K, the structure exhibits an incommensurate charge density wave. This data was taken at 370 K, so the structure given here is only approximate. Below 285 K the CDW is locked in, leading to the low-temperature Mo_8O_{23} structure.

Simple Monoclinic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

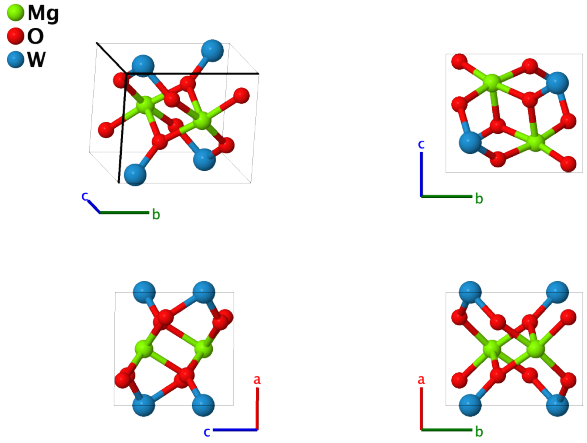
Huanzalaite ($MgWO_4$, $H0_6$) Structure: AB4C_mP12_13_f_2g_e

http://aflow.org/prototype-encyclopedia/AB4C_mP12_13_f_2g_e



Prototype	:	MgO_4W
AFLOW prototype label	:	AB4C_mP12_13_f_2g_e
***Strukturbericht* designation**	:	$H0_6$
Pearson symbol	:	mP12
Space group number	:	13
Space group symbol	:	$P2/c$
AFLOW prototype command	:	`aflow --proto=AB4C_mP12_13_f_2g_e --params=`$a, b/a, c/a, \beta, y_1, y_2, x_3, y_3, z_3, x_4, y_4, z_4$

Other compounds with this structure

- $CoWO_4$, $FeWO_4$ (ferberite), $MnWO_4$ (hübernite), $NiWO_4$, and $ZnWO_4$

- Most authors refer to this as the wolframite structure, but that name properly belongs to the solid solution $(Mn,Fe)WO_4$. (Herman, 1937) chose this "magnesium wolframite" compound to represent the $H0_6$ structures.

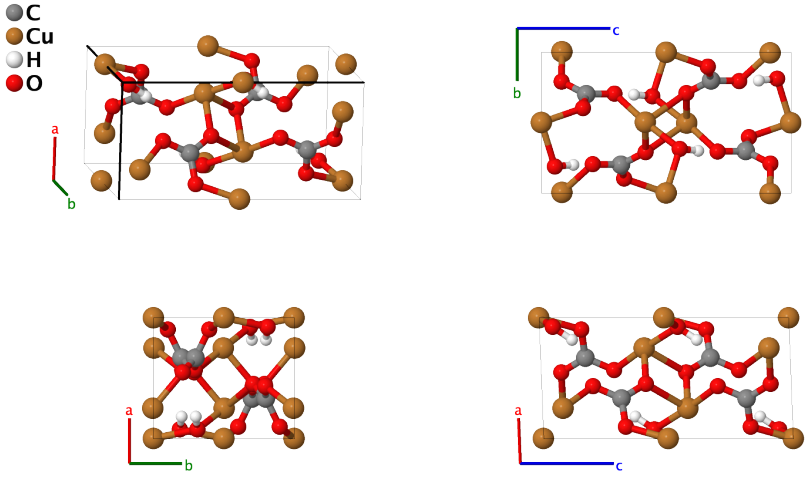
Azurite [$Cu_3(CO_3)_2(OH)_2$, $G7_4$] Structure: A2B3C2D8_mP30_14_e_ce_e_4e

http://aflow.org/prototype-encyclopedia/A2B3C2D8_mP30_14_e_ce_e_4e



Prototype	:	$C_2Cu_3H_2O_8$
AFLOW prototype label	:	A2B3C2D8_mP30_14_e_ce_e_4e
***Strukturbericht* designation**	:	$G7_4$
Pearson symbol	:	mP30
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=A2B3C2D8_mP30_14_e_ce_e_4e --params=`$a, b/a, c/a, \beta, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- (Rule, 2011) actually present two possible structures for azurite: the current structure, with space group $P2_1/c$ #14, which is identical to the structure designated $G7_4$ by (Hermann, 1937), except that the OH radical is now separated into the O(IV) and H atom sites; and a structure with the same unit cell dimensions but without an inversion site, leading to space group $P2_1$ #4. The actual difference between the two structures is extremely small, and we choose to use the traditional structure.
- Structural information was taken from powder diffraction data at 1.28 K.

Simple Monoclinic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

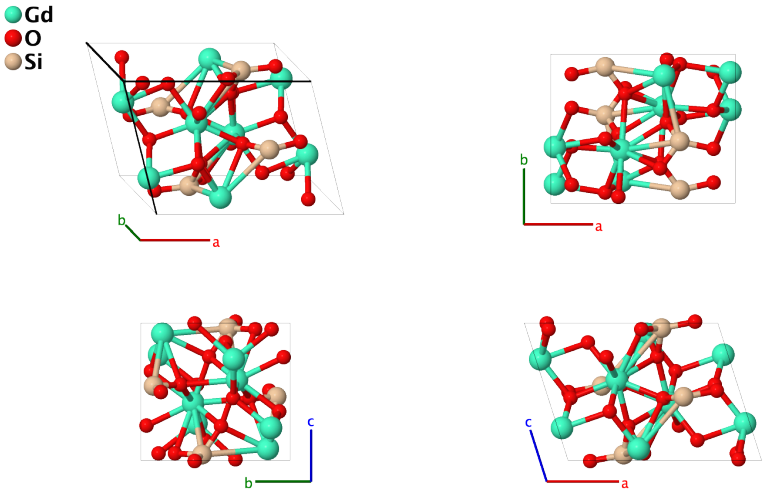
Gd_2SiO_5 (RE_2SiO_5 X1) Structure: A2B5C_mP32_14_2e_5e_e

http://aflow.org/prototype-encyclopedia/A2B5C_mP32_14_2e_5e_e



Prototype	:	Gd_2O_5Si
AFLOW prototype label	:	A2B5C_mP32_14_2e_5e_e
***Strukturbericht* designation**	:	None
Pearson symbol	:	mP32
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=A2B5C_mP32_14_2e_5e_e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

Other compounds with this structure

- Dy_2SiO_5, La_2SiO_5, Tb_2SiO_5, and Y_2SiO_5

- Compounds of the form $RESiO_5$ (RE = Rare Earth and related elements) crystallize in one of two forms (Wang, 2001 and Tian, 2016): X1, shown here, for rare earths between lanthanum and gadolinium, and X2, space group $C2/c$ #15 for the later rare earths, with the dysprosium, yttrium and ytterbium compounds existing in both structures.

Simple Monoclinic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

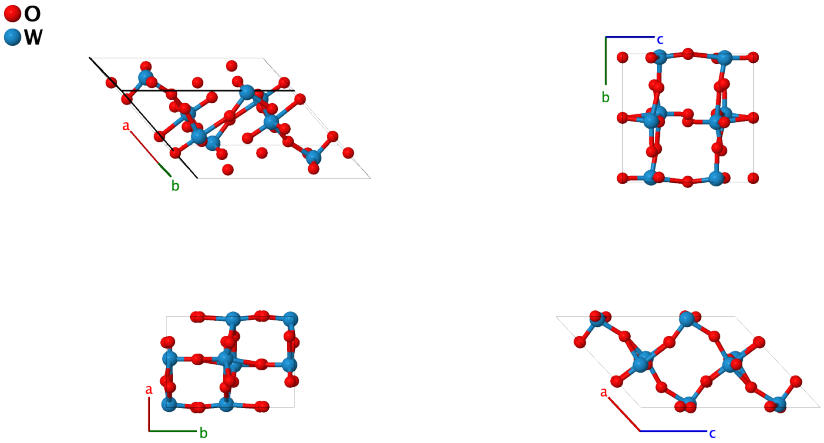
γ-WO_3 Structure: A3B_mP32_14_6e_2e

http://aflow.org/prototype-encyclopedia/A3B_mP32_14_6e_2e



Prototype	:	O_3W
AFLOW prototype label	:	A3B_mP32_14_6e_2e
***Strukturbericht* designation**	:	None
Pearson symbol	:	mP32
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=A3B_mP32_14_6e_2e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- All stable phases of WO_3 are distortions of the cubic α-ReO_3 ($D0_9$) phase. Based on (Woodward, 1997 and Vogt, 1999), the known stable phases and their approximate temperature ranges are:
  - α-WO_3 (1010-1170 K) (Vogt, 1999)
  - β-WO_3 (600-1170 K) (Vogt, 1999)
  - γ-WO_3 (290-600 K) (Vogt, 1999), this structure
  - δ-WO_3 (230-290 K) (Diehl, 1978)
  - ϵ-WO_3 (below 23 K) (Woodward, 1997)

  Woodward's caption says "The transition temperatures display large hysteresis effects and universal agreement is not found in the literature."
- In addition, several other structures have been proposed and/or found:
  - The original $D0_{10}$ structure (Bräkken, 1931), (Hermann, 1937) superseded by δ-WO_3
  - Original β-WO_3 (Salje, 1977)
  - Hexagonal WO_3 (Gerand, 1979) (metastable)

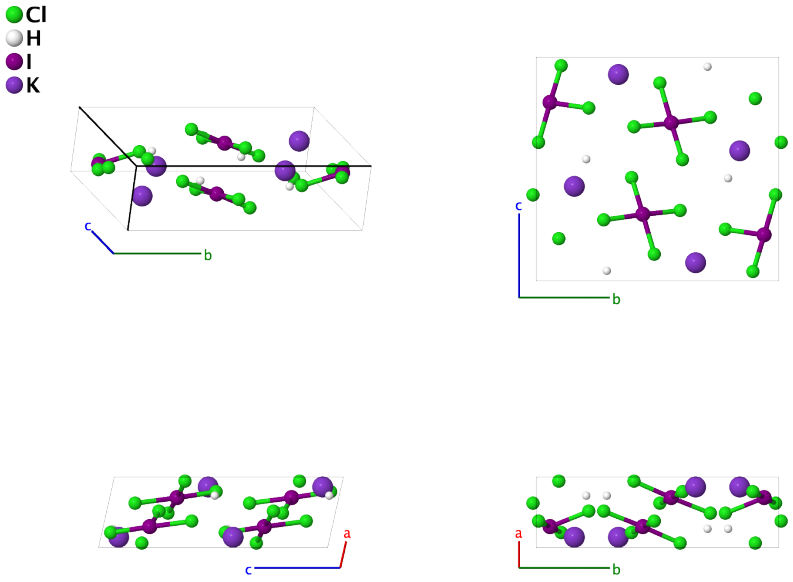
$KICl_4{\cdot}H_2O$ ($H0_{10}$) Structure: A4BCD_mP28_14_4e_e_e_e

http://aflow.org/prototype-encyclopedia/A4BCD_mP28_14_4e_e_e_e



Prototype	:	$Cl_4IK \cdot H_2O$
AFLOW prototype label	:	A4BCD_mP28_14_4e_e_e_e
***Strukturbericht* designation**	:	$H0_{10}$
Pearson symbol	:	mP28
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=A4BCD_mP28_14_4e_e_e_e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7$

- The structure of $KICl_4$ was originally determined by (Mooney, 1938) and assigned *Strukturbericht* designation $H0_{10}$ by (Herrmann, 1941). According to (Elema, 1963), "During Mooney's structure determination of $KIC1_4 \cdot H_2O$ it was not realized that the crystals contain water of crystallization." The correct structure is essentially the same as Mooney's with water molecules added into the vacancies, and we use $KICl_4 \cdot H_2O$ as our prototype for $H0_{10}$. To return to Mooney's structure, remove the water molecules, but of course this will not be a stable structure.
- The Wyckoff positions given by both (Mooney, 1938) and (Elema, 1963) are in the $P2_1/n$ setting of space group #14. We have used FINDSYM to translate this to the standard $P2_1/c$ setting.

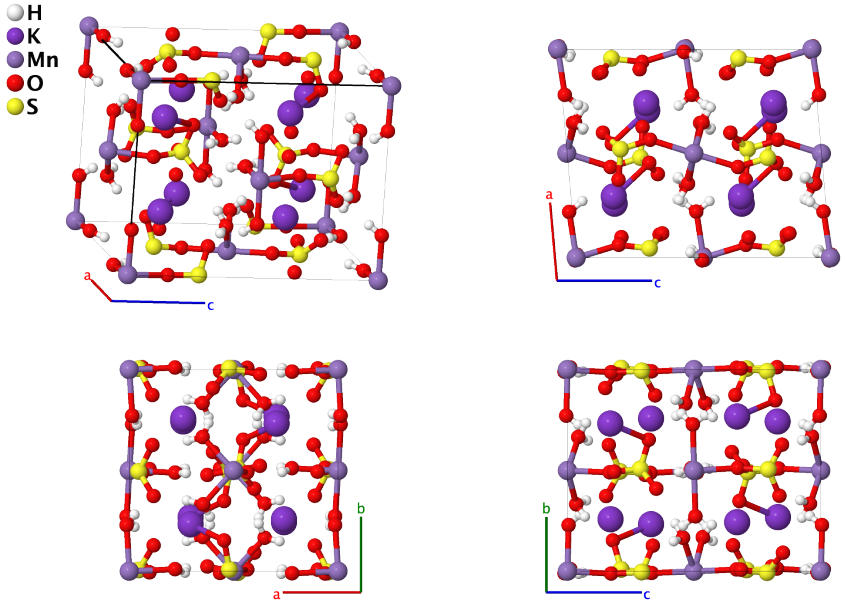
Manganese-leonite 110 K [$K_2Mn(SO_4)_2{\cdot}4H_2O$] Structure: A8B2CD12E2_mP100_14_8e_2e_ad_12e_2e

http://aflow.org/prototype-encyclopedia/A8B2CD12E2_mP100_14_8e_2e_ad_12e_2e



Prototype	:	$H_8K_2MnO_{12}S_2$
AFLOW prototype label	:	A8B2CD12E2_mP100_14_8e_2e_ad_12e_2e
***Strukturbericht* designation**	:	None
Pearson symbol	:	mP100
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=A8B2CD12E2_mP100_14_8e_2e_ad_12e_2e --params=`$a, b/a, c/a, \beta, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}, x_{18}, y_{18}, z_{18}, x_{19}, y_{19}, z_{19}, x_{20}, y_{20}, z_{20}, x_{21}, y_{21}, z_{21}, x_{22}, y_{22}, z_{22}, x_{23}, y_{23}, z_{23}, x_{24}, y_{24}, z_{24}, x_{25}, y_{25}, z_{25}, x_{26}, y_{26}, z_{26}$

Other compounds with this structure

- $K_2Mg(SO_4)_2{\cdot}4H_2O$ (leonite)

- This is the intermediate-low temperature structure of leonite. For Mn-leonite, discussed here, it is stable below 168 K. The structure shown here was determined at 110 K.
- The room temperature structure is *Strukturbericht* $H4_{23}$, space group $C2/m$ #13. The current structure doubles the size of the unit cell and orders all of the SO_4 radicals.
- The intermediate temperature structure (168-205 K) has space group $P2_1/c$ #14.
- (Hertweck, 2001) give crystallographic information of this phase in the $P2_1/a$ setting of space group #14. We used FINDSYM to transform this to the $P2_1/c$ setting, which resulted in a switching of the a- and c-axes.

Simple Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

Other compounds with this structure

- $Cd(NH_4)_2(SO_4)_2{\cdot}6H_2O$, $Co(NH_4)_2(SO_4)_2{\cdot}6H_2O$, $Fe(NH_4)_2(SO_4)_2{\cdot}6H_2O$, $Mg(NH_4)_2(SO_4)_2{\cdot}6H_2O$, $Mn(NH_4)_2(SO_4)_2{\cdot}6H_2O$, $Ni(NH_4)_2(SO_4)_2{\cdot}6H_2O$, $V(NH_4)_2(SO_4)_2{\cdot}6H_2O$, $Zn(NH_4)_2(SO_4)_2{\cdot}6H_2O$, $Mg(NH_4)_2(SeO_4)_2{\cdot}6H_2O$, $Co(KSO_4)_2{\cdot}6H_2O$, $Cu(KSeO_4)_2{\cdot}6H_2O$, $Cu(KSO_4)_2{\cdot}6H_2O$, $Mg(KSO_4)_2{\cdot}6H_2O$, $Mg(TlSO_4)_2{\cdot}6H_2O$, and $Ni(KSO_4)_2{\cdot}6H_2O$

- Tutton Salts have the form $AB_2(SO_4)_2{\cdot}6H_2O$, were A is a divalent ion and B is a monovalent ion. (Hermann, 1937) formally lists $Mg(NH_4)_2(SO_4)_2{\cdot}6H_2O$ as the prototype, but notes that one may have "other monovalent metals in place of NH_4 and divalent [metals] in place of Mg." We choose $Cu(NH_4)_2(SO_4)_2{\cdot}6H_2O$ as the prototype because (Brown, 1969) were able to locate all of the hydrogen ions in agreement with expectation, *i.e.*, H_2O molecules have properly bent H-O bonds, and the hydrogen atoms in the ammonium ion form a tetrahedron around the nitrogen atom.
- The atomic positions were originally given in the $P2_1/a$ setting of space group #14. We used FINDSYM to convert this to the standard $P2_1/c$ setting. This resulted in the a and c axes being swapped.

Simple Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

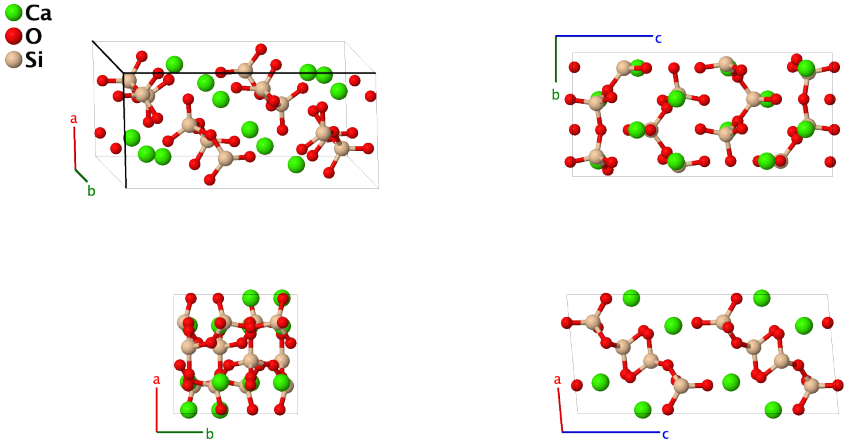
Parawollastonite ($CaSiO_3$, $S3_3$ (II)) Structure: AB3C_mP60_14_3e_9e_3e

http://aflow.org/prototype-encyclopedia/AB3C_mP60_14_3e_9e_3e



Prototype	:	CaO_3Si
AFLOW prototype label	:	AB3C_mP60_14_3e_9e_3e
***Strukturbericht* designation**	:	$S3_3$ (II)
Pearson symbol	:	mP60
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=AB3C_mP60_14_3e_9e_3e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}$

- (Trojer, 1968) refined the original structure of (Barnick, 1936). While Barnick referred to this structure as "wollastonite," in modern terminology it is called "parawollastonite," with the original name used for the triclinic $CaSiO_3$ form.
- (Gottfried, 1938) gave this structure the $S3_3$ designation, but (Gottfried, 1937) had already used this label for crancrinite, $Na_6Ca_2Al_6Si_6O_{24}(CO_3)_2$. We will refer to parawollastonite as $S3_3$ (II), and crancrinite as $S3_3$ (I).

Simple Monoclinic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

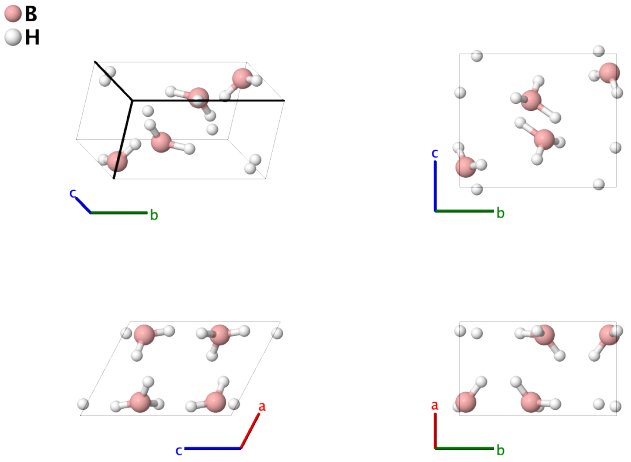
β-B_2H_6 Structure: AB3_mP16_14_e_3e

http://aflow.org/prototype-encyclopedia/AB3_mP16_14_e_3e.beta

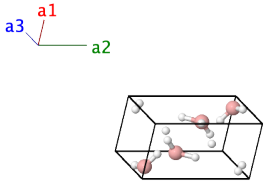


Prototype	:	β-B_2H_6
AFLOW prototype label	:	AB3_mP16_14_e_3e
***Strukturbericht* designation**	:	None
Pearson symbol	:	mP16
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=AB3_mP16_14_e_3e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4$

- (Mark, 1925) studied a variety of B_2H_6 structures, including the one given *Strukturbericht* designation $D4_1$ by (Ewald, 1931). (Smith, 1965) refined this structure, including the hydrogen positions.
- This structure shares the same AFLOW designation, AB3_mP16_14_e_3e, as the B_2H_6 structure defined by (Yao, 2011). If we remove the hydrogen atoms from either of these structures we get the A10 (α-Hg) structure, but that is more closely associated with the Yao structure than it is with this one.
- (Smith, 1965) presented the crystallographic information for this structure in the $P2_1/n$, unique axis c, setting of space group #14. We used FINDSYM to put the information into the standard $P2_1/c$, unique axis b, setting. This involved modifications of the primitive vectors beyond a simple rotation.

Simple Monoclinic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type

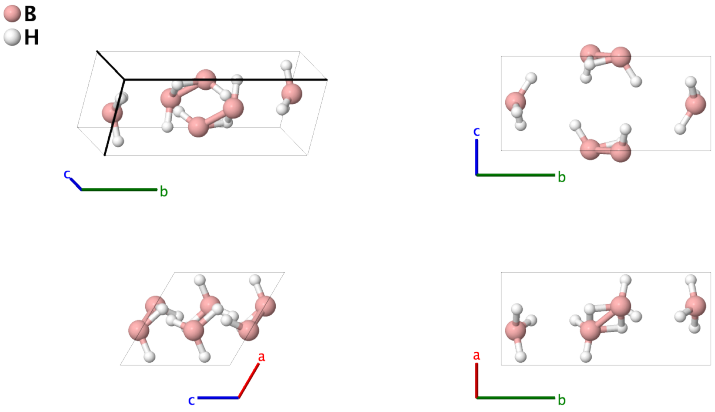
B_2H_6 ($P2_1/c$) Structure: AB3_mP16_14_e_3e

http://aflow.org/prototype-encyclopedia/AB3_mP16_14_e_3e



Prototype	:	B_2H_6
AFLOW prototype label	:	AB3_mP16_14_e_3e
***Strukturbericht* designation**	:	None
Pearson symbol	:	mP16
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=AB3_mP16_14_e_3e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4$

- (Mark, 1925) studied a variety of B_2H_6 structures, including the one given *Strukturbericht* designation $D4_1$ by (Ewald, 1931). Very little information was given about this structure, other than Ewalds's statement "The position of the boron atoms is exactly the same as that of the Hg atoms in the A10 (α-Hg) structure." (Yao, 2011) found the current structure computationally, and note that it is likely the structure found by (Mark, 1925).
- This structure shares the same AFLOW designation, AB3_mP16_14_e_3e, as the β-B_2H_6 structure described by (Smith, 1965).

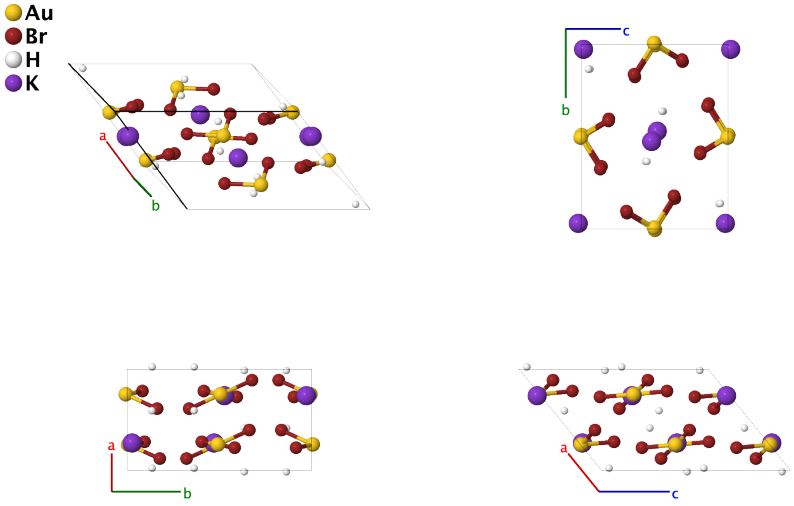
$KAuBr_4{\cdot}2H_2O$ ($H4_{19}$) Structure: AB4C2D_mP32_14_e_4e_2e_e

http://aflow.org/prototype-encyclopedia/AB4C2D_mP32_14_e_4e_2e_e



Prototype	:	$AuBr_4(H_2O)_2K$
AFLOW prototype label	:	AB4C2D_mP32_14_e_4e_2e_e
***Strukturbericht* designation**	:	$H4_{19}$
Pearson symbol	:	mP32
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=AB4C2D_mP32_14_e_4e_2e_e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- (Cox, 1936) determined lattice constants for $KAuBr_4{\cdot}H_2O$, which were very close to those later found by (Omrani, 1986). However, Cox *et al.* found that the (100) planes (in our orientation) with odd indices showed very weak diffraction spots. Neglecting these spots gives a unit cell which has a lattice constant a (in our orientation) which is half the size of that found by Omrani *et al*, and so the Pearson symbol mP16. Fitting this cell into space group $P2_1/c$ #14 then required that the gold atom be at the ($2a$) Wyckoff position and the potassium atom at ($2b$), while the later paper found that these atoms are slightly displaced from these points.
- The results of (Omrani, 1986) are very close to those of (Cox, 1936) and can indeed reduce to the Cox *et al.* structure by allowing some uncertainty in the atomic positions. Given this, and the fact that the former reference actually found the correct unit cell, we will use the more modern work as our prototype for *Strukturbericht* symbol $H4_{19}$.
- (Omrani, 1986) gave the unit cell and Wyckoff positions in terms of setting $P2_1/n$ of space group #14. Changing this to the standard $P2_1/c$ setting required a rotation of the lattice and a significant rewriting of the primitive vectors.
- The anhydrous form of this compound can be seen at $KAuBr_4$ (AB4C_mP24_14_ab_4e_e).

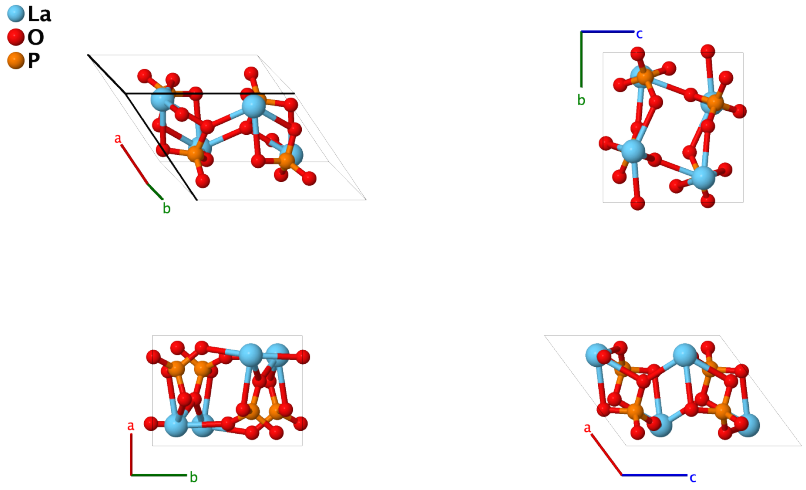
Monazite ($LaPO_4$) Structure: AB4C_mP24_14_e_4e_e

http://aflow.org/prototype-encyclopedia/AB4C_mP24_14_e_4e_e



Prototype	:	LaO_4P
AFLOW prototype label	:	AB4C_mP24_14_e_4e_e
***Strukturbericht* designation**	:	None
Pearson symbol	:	mP24
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=AB4C_mP24_14_e_4e_e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

Other compounds with this structure

- $CePO_4$ (monazite-Ce), $PrPO_4$ (monazite-Pr), $NdPO_4$ (monazite-Nd), $SmPO_4$ (monazite-Sm), $EuPO_4$ (monazite-Eu), $LaAsO_4$ (gasparite-La), and $CeAsO_4$ (gasparite-Ce)

- Monazites (RE-PO_4) and gasparites (RE-AsO_4) can have a mixture of rare earth elements in the RE slot of the formula. Technically these minerals are called monazite-(X) and gasparite-(X), where "X" is the predominant rare earth element in the sample. All of the structures are similar, but we must pick one as the prototype, so we take the first entry in (Ni, 1995) to define the class.
- (Ni, 1995) gives the structural data in the $P2_1/n$ setting of space group #14. We used FINDSYM to change this to our standard $P2_1/c$ setting. This involves a change of primitive vectors as well as a rotation of the crystal.
- This structure has the same AFLOW label as NH_4SO_4, $K4_1$. The structures are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.

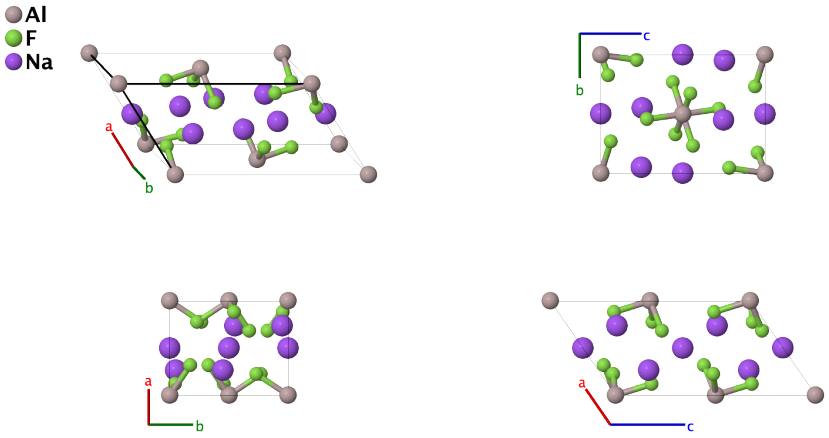
Cryolite (Na_3AlF_6, $J2_6$) Structure: AB6C3_mP20_14_a_3e_de

http://aflow.org/prototype-encyclopedia/AB6C3_mP20_14_a_3e_de

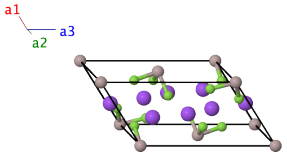


Prototype	:	AlF_6Na_3
AFLOW prototype label	:	AB6C3_mP20_14_a_3e_de
***Strukturbericht* designation**	:	$J2_6$
Pearson symbol	:	mP20
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=AB6C3_mP20_14_a_3e_de --params=`$a, b/a, c/a, \beta, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

- Cryolite undergoes a phase transition to an orthorhombic *Immm* phase at 890 K. Here we use structural data taken at 295 K.
- (Yang, 1993) gives the Wyckoff positions for the orientation $P2_1/n$ of space group #14. We used FINDSYM to change this to the standard $P2_1/c$ orientation. This included a change in the primitive vectors and the shift of the sodium atom on the ($2b$) site to the ($2d$) site.

Simple Monoclinic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

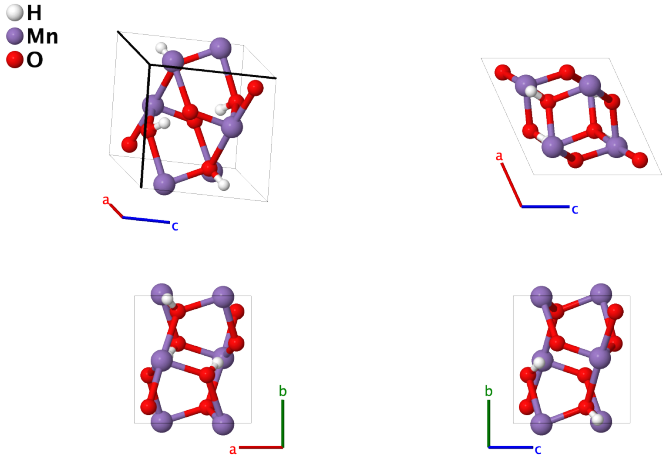
Manganite (γ-MnO(OH), $E0_6$) Structure: ABC2_mP16_14_e_e_2e

http://aflow.org/prototype-encyclopedia/ABC2_mP16_14_e_e_2e



Prototype	:	$MnHO_2$
AFLOW prototype label	:	ABC2_mP16_14_e_e_2e
***Strukturbericht* designation**	:	$E0_6$
Pearson symbol	:	mP16
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=ABC2_mP16_14_e_e_2e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4$

- (Buerger, 1936) originally determined the positions of the manganese and oxygen atoms using the $B2_1/d$ setting of space group #14. This structure was given the *Strukturbericht* designation $E0_6$ in (Gottfried, 1938). Much later, (Kohler, 1997) found the positions of the hydrogen atoms, and presented the data in the standard $P2_1/c$ setting of space group #14.

Simple Monoclinic primitive vectors:

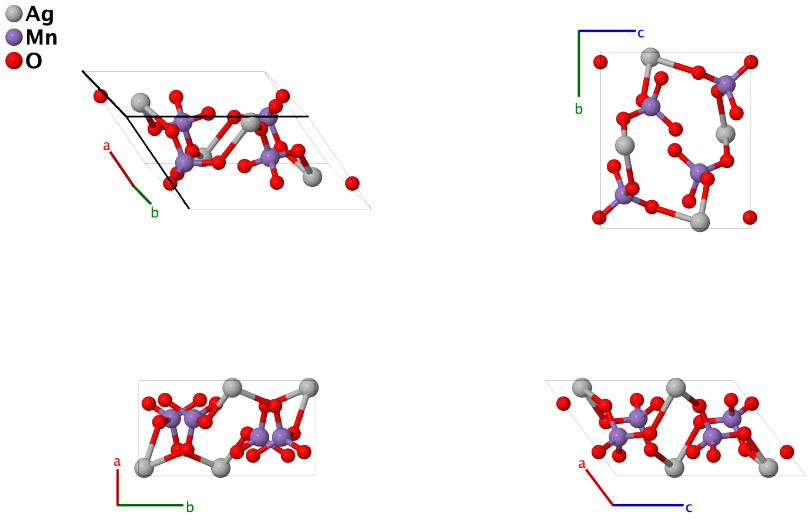
$AgMnO_4$ ($H0_9$) Structure: ABC4_mP24_14_e_e_4e

http://aflow.org/prototype-encyclopedia/ABC4_mP24_14_e_e_4e



Prototype	:	$AgMnO_4$
AFLOW prototype label	:	ABC4_mP24_14_e_e_4e
***Strukturbericht* designation**	:	$H0_9$
Pearson symbol	:	mP24
Space group number	:	14
Space group symbol	:	$P2_1/c$
AFLOW prototype command	:	`aflow --proto=ABC4_mP24_14_e_e_4e --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

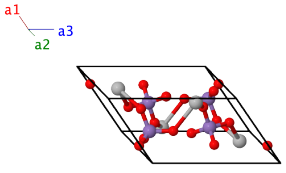
Other compounds with this structure

- $CaSO_4$, $SrCrO_4$, $InVO_4$, $CsSO_4$, and $(NH_4)SO_4$

- The structure of $AgMnO_4$ was originally determined by (Sasvári, 1938) and refined by (Boonstra, 1968). In particular, Boonstra found that the actual positions of the Ag and Mn atoms were switched compared to the structure found by Sasvári. As the lattice constants remain approximately the same and there was no change in the space group or the occupied Wyckoff positions, we use the Boonstra structure to define *Strukturbericht* designation $H0_9$.
- Boonstra gave the structure in setting $P2_1/n$ of space group #14. We used FINDSYM to translate the structure to the standard $P2_1/c$ setting. This included a redefinition of the primitive vectors of the lattice.

Simple Monoclinic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

- This is more commonly known as sodium bicarbonate or baking soda.
- (Sass, 1962) do not locate the hydrogen atoms.
- (Zachariasen, 1933) applied chemical and crystallographic reasoning and placed the hydrogen atoms halfway between each O II atom and the nearest O III atom. We use this structure, while realizing that the hydrogen positions are only approximate.

Simple Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

- Realgar transforms to pararealgar on exposure to visible light with wavelengths in the range 500-670 nm (Douglass, 1992).
- (Ito, 1952) give the crystal structure of realgar in the $P2_1/n$ setting of space group #14. We have used FINDSYM to transform this to the standard $P2_1/c$ setting. This involved both rotations and an origin shift.

- (Byström, 1950) gives the structure in the $I2/c$ setting of space group #15. We have used FINDSYM to change this to the standard $C2/c$ setting. This conversion involved a rotation of the axis, and placed the origin on what had been an Ag ($4d$) site, tranforming it to Ag ($4a$).

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

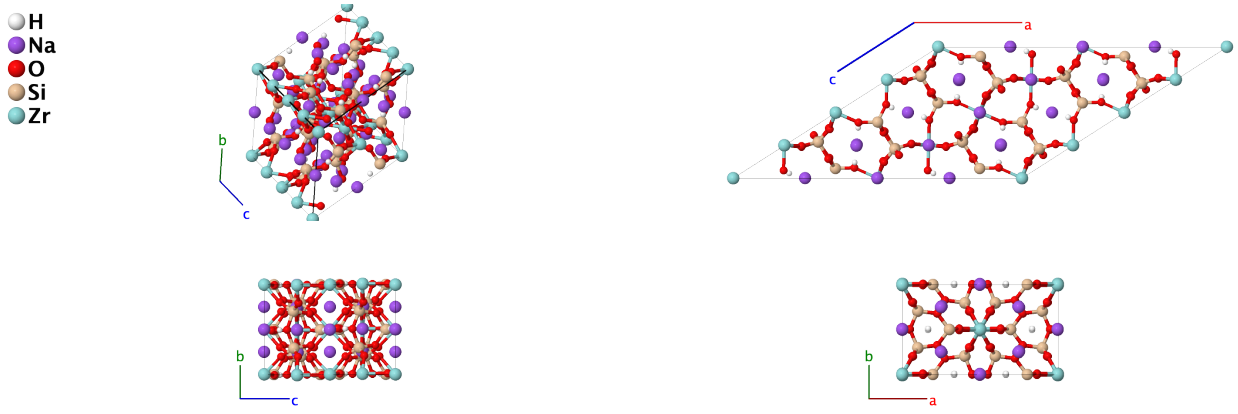
Catapleiite ($Na_2ZrSi_3O_9{\cdot}2H_2O$) Structure: A2B3C9D3E_mC144_15_2f_bcdef_9f_3f_ae

http://aflow.org/prototype-encyclopedia/A2B3C9D3E_mC144_15_2f_bcdef_9f_3f_ae



Prototype	:	$(H_2O)_2Na_2O_9Si_3Zr$
AFLOW prototype label	:	A2B3C9D3E_mC144_15_2f_bcdef_9f_3f_ae
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC144
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=A2B3C9D3E_mC144_15_2f_bcdef_9f_3f_ae --params=`$a, b/a, c/a, \beta, y_5, y_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}, x_{18}, y_{18}, z_{18}, x_{19}, y_{19}, z_{19}, x_{20}, y_{20}, z_{20}, x_{21}, y_{21}, z_{21}$

- This is a refinement of the crystal structure of catapleiite. The original hexagonal structure was given the *Strukturbericht* designation $S\,3_4$ by (Gottfried, 1937).
- The sodium atom sites are only 66.7% occupied in this structure. However, the stoichiometry in the AFLOW label treats the Na sites as fully occupied (*i.e.*, a stoichiometric ratio of three as opposed to two).
- (Ilyushin, 1981) gave the lattice parameters and Wyckoff positions in terms of the $B2/b$ setting of space group #15. We used FINDSYM to transform this to the standard $C2/c$ setting. This required the $y-$ and $z-$axes to be swapped.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$

Other compounds with this structure

- Na_2CrO_3 and Na_2TbO_3

- (Hinatsu, 2006) found that the site we have labeled Na-II is actually 2/3 sodium and 1/3 praseodymium, statistically distributed, while the site we label Pr-I is 1/3 sodium and 2/3 praseodymium.

- Eudidymite and its dimorph, epididymite ($S4_7$) are two forms of hydrated sodium beryllium silicate which are stable under ambient conditions. (Diego Gatta, 2008)
- The occupancy of the sites making up the water molecule (H-I, H-II and O-IX) is 50%. In the picture on this page the atoms forming the water molecules appear doubled because of this.

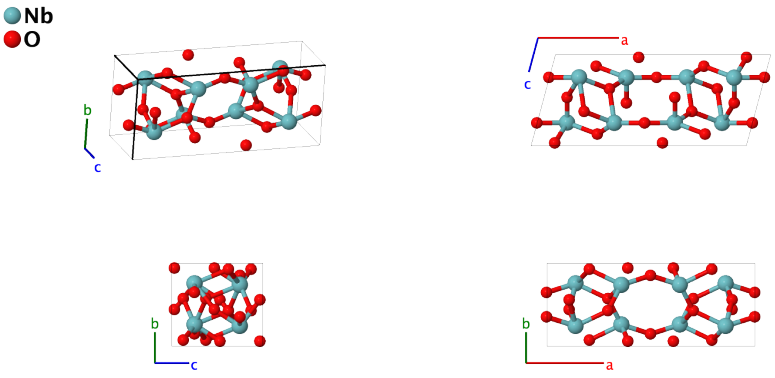
ζ-Nb_2O_5 (B-Nb_2O_5) Structure: A2B5_mC28_15_f_e2f

http://aflow.org/prototype-encyclopedia/A2B5_mC28_15_f_e2f.Nb2O5



Prototype	:	Nb_2O_5
AFLOW prototype label	:	A2B5_mC28_15_f_e2f
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC28
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=A2B5_mC28_15_f_e2f --params=`$a, b/a, c/a, \beta, y_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4$

Other compounds with this structure

- Sb_2O_5

- This structure is referred to as both ζ-Nb_2O_5 and B-Nb_2O_5.
- Nb_2O_5 and B_2Pd_5 share the same AFLOW prototype label, A2B5_mC28_15_f_e2f, but have substantially different environments around each atom. The structures are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

- The sites we label Si-I and Si-II are actually approximately 75% silicon and 25% aluminum, but trace elements like manganese can appear on both sites. In addition, the potassium site (K) can be alloyed with small amounts of sodium, and the aluminum site (Al) with iron. These trace elements give muscovite a variety of colors. The sample studied by (Richardson, 1982) was pink.

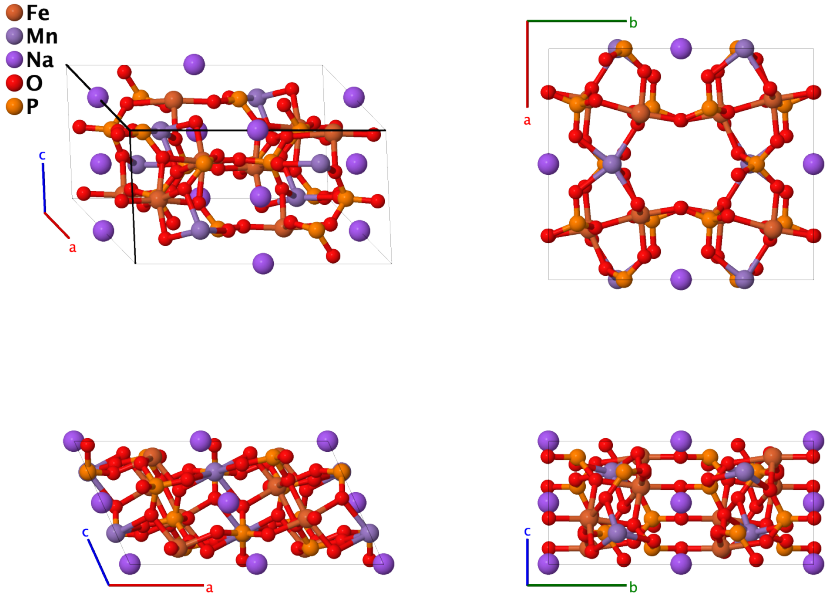
Alluaudite [$NaMnFe_2(PO_4)_3$] Structure: A2BCD12E3_mC76_15_f_e_b_6f_ef

http://aflow.org/prototype-encyclopedia/A2BCD12E3_mC76_15_f_e_b_6f_ef



Prototype	:	$Fe_2MnNaO_{12}P_3$
AFLOW prototype label	:	A2BCD12E3_mC76_15_f_e_b_6f_ef
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC76
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=A2BCD12E3_mC76_15_f_e_b_6f_ef --params=`$a, b/a, c/a, \beta, y_2, y_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}$

Other compounds with this structure

- $Ag_xNa_{1-x}Mn_3(PO_4)_3$, $Li_xNa_{1-x}CdIn_2(PO_4)_3$, $Li_xNa_{1-x}MnFe_2(PO_4)_3$, $Na_2(Fe,Co)Fe(VO_4)_3$, $Na_2Co_2Cr(PO_4)_3$, $Na_2Fe_2V(PO_4)_3$, $Na_2Zn_2Fe(VO_4)_3$, $Na_3Bi_2(AsO_4)_3$, $Na_4Co(MnO_4)_3$, and $Na_xMn_yAl_{5-x-y}(PO_4)_3$

- This is a rather idealized version of alluaudite. (Moore, 1971) gives the composition of the sodium site (Na) as $Na_{0.625}Mn_{0.175}Ca_{0.125}$, with vacancies on the remaining sites; the manganese (Mn) site is $Mn_{0.950}Mg_{0.025}Li_{0.025}$; and the iron (Fe) site as $Fe_{0.988}Mg_{0.012}$. (Hatert, 2005) puts some sodium atoms on another ($4e$) site, with $y \approx 0$; the exact placement and concentration depends upon the manganese content. We may expect similar variations in other compounds having this structure.

Base-centered Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

AFLOW prototype label	:	A3B16C20D3_mC168_15_ef_8f_10f_ef
***Strukturbericht* designation**	:	$H4_{20}$
Pearson symbol	:	mC168
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=A3B16C20D3_mC168_15_ef_8f_10f_ef --params=`$a, b/a, c/a, \beta, y_1, y_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}, x_{18}, y_{18}, z_{18}, x_{19}, y_{19}, z_{19}, x_{20}, y_{20}, z_{20}, x_{21}, y_{21}, z_{21}, x_{22}, y_{22}, z_{22}$

- Some of the H-O distances appear to be very small. For example, the O-VIII – H-III distance is only 0.43Å. We have checked our inputs compared to (Caminiti, 1981) and found no error. Unfortunately they do not provide H-O distances for comparison.

Base-centered Monoclinic primitive vectors:

Prototype	:	$Mg_3O_5(OH)_4Si_2$
AFLOW prototype label	:	A3B5C4D2_mC112_15_a3ef_5f_4f_2f
***Strukturbericht* designation**	:	$S5_5$
Pearson symbol	:	mC112
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=A3B5C4D2_mC112_15_a3ef_5f_4f_2f --params=`$a, b/a, c/a, \beta, y_2, y_3, y_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}$

- We follow the interpretation of (McMurchy, 1934) as given by (Downs, 2003): The sites we have labeled "Mg ($4e$)" are actually 2/3 magnesium and 1/3 aluminum, and the sites we have labeled "Si ($8f$)" are 3/4 silicon and 1/4 aluminum.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

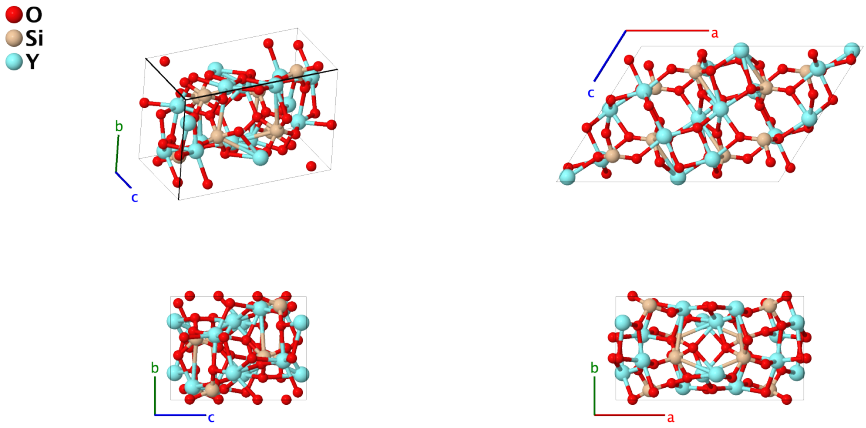
Y_2SiO_5 (RE_2SiO_5 X2) Structure: A5BC2_mC64_15_5f_f_2f

http://aflow.org/prototype-encyclopedia/A5BC2_mC64_15_5f_f_2f



Prototype	:	O_5SiY_2
AFLOW prototype label	:	A5BC2_mC64_15_5f_f_2f
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC64
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=A5BC2_mC64_15_5f_f_2f --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

Other compounds with this structure

- Dy_2SiO_5, Er_2SiO_5, Ho_2SiO_5, Lu_2SiO_5, Tb_2SiO_5, Tm_2SiO_5, and Yb_2SiO_5

- Compounds of the form $RESiO_5$ (RE = Rare Earth and related elements) crystallize in one of two forms (Wang, 2001 and Tian, 2016): X1, space group $P2_1/c$ #14, for rare earths between lanthanum and gadolinium, and X2, this structure, for the later rare earths, with the dysprosium, yttrium and ytterbium compounds existing in both structures.
- This is the high temperature phase of Y_2SiO_5. Below 1190 °C it transforms into the X1 phase.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$

Prototype	:	$H_8K_2MnO_{12}S_2$
AFLOW prototype label	:	A8B2CD12E2_mC200_15_8f_2f_ce_2e11f_2f
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC200
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=A8B2CD12E2_mC200_15_8f_2f_ce_2e11f_2f --params=`$a, b/a, c/a, \beta, y_2, y_3, y_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}, x_{18}, y_{18}, z_{18}, x_{19}, y_{19}, z_{19}, x_{20}, y_{20}, z_{20}, x_{21}, y_{21}, z_{21}, x_{22}, y_{22}, z_{22}, x_{23}, y_{23}, z_{23}, x_{24}, y_{24}, z_{24}, x_{25}, y_{25}, z_{25}, x_{26}, y_{26}, z_{26}, x_{27}, y_{27}, z_{27}$

Other compounds with this structure

- $K_2Mg(SO_4)_2{\cdot}4H_2O$ (leonite) and $K_2Fe(SO_4)_2{\cdot}4H_2O$ (mereiterite)

- This is the intermediate-low temperature structure of leonite. For Mn-leonite, discussed here, it is stable between 168 K and 205 K, and we show the structure at 185 K.
- The room temperature structure is *Strukturbericht* $H4_{23}$, space group $C2/m$ #13. The current structure doubles the size of the unit cell and orders all of the SO_4 radicals.
- The low temperature structure has space group $P2_1/c$ #14.
- (Hertweck, 2001) give crystallographic information of the 185 K phase in the $I2/a$ setting of space group #15, with the origin supposedly shifted by $(1/4, 1/4, 1/2)$ from the -1 point on the a-glide plane (the symmetry operations for this setting may be found here). We were unable to use their data to construct a realistic crystal structure. Instead, we used the interpretation of their results by (Villars, 2016) to put the structure in the standard $C2/c$ setting of space group #15.

Base-centered Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

Other compounds with this structure

- $BaC_4N_4Pd \cdot 4H_2O$ and $BaC_4N_4Pt \cdot 4H_2O$

- We use the structure found by (Larsen, 1969). It is very similar to the structure found by (Brasseur, 1938) which was designated $H4_{22}$ by (Herrmann, 1941). The newer structure was able to separate the carbon and nitrogen atoms in the cyanide (CN) radical, and also move the barium atom from the ($4b$) to the ($4e$) Wyckoff position.

Base-centered Monoclinic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}\end{aligned}$$

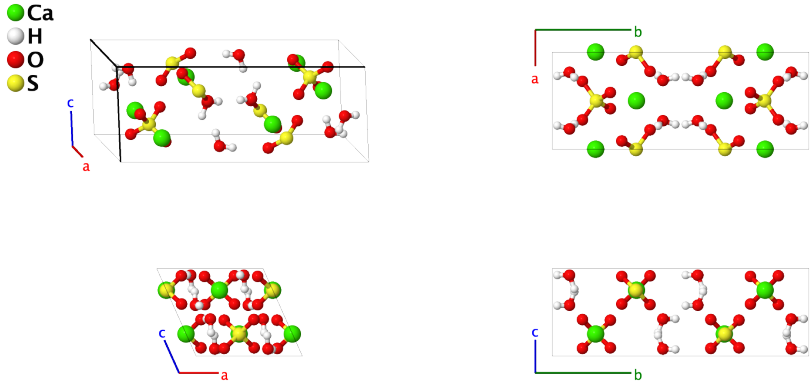
Gypsum ($CaSO_4{\cdot}2H_2O$, $H4_6$) Structure: AB4C6D_mC48_15_e_2f_3f_e

http://aflow.org/prototype-encyclopedia/AB4C6D_mC48_15_e_2f_3f_e



Prototype	:	CaH_4O_6S
AFLOW prototype label	:	AB4C6D_mC48_15_e_2f_3f_e
***Strukturbericht* designation**	:	$H4_6$
Pearson symbol	:	mC48
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=AB4C6D_mC48_15_e_2f_3f_e --params=`$a, b/a, c/a, \beta, y_1, y_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7$

- (Onorato, 1929) determined that gypsum was in space group $C2/m$ #12, and (Hermann, 1937) assigned this to *Strukturbericht* $H4_6$. However, (Wooster, 1936) and others determined that the correct space group was $C2/c$ #15, and (Gottfried, 1938) assigned the $H4_6$ symbol to this structure. We use the 1 atmosphere data of (Comodi, 2008), who also determine the positions of the hydrogen atoms.

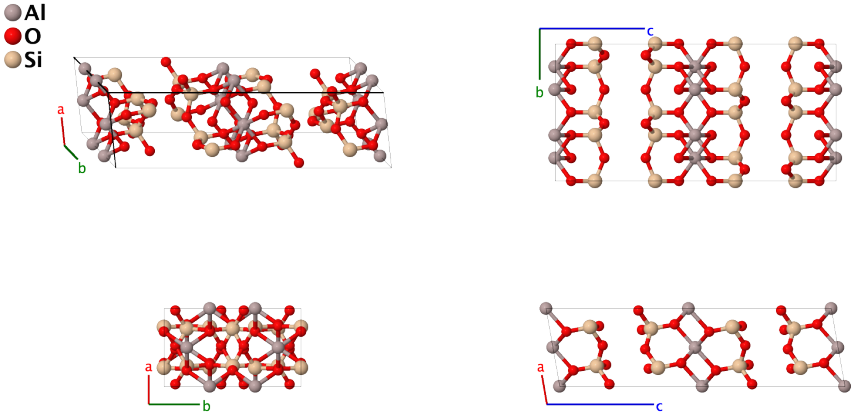
Pyrophyllite [$AlSi_2O_5(OH)$, $S5_6$] Structure: AB5CD2_mC72_15_f_5f_f_2f

http://aflow.org/prototype-encyclopedia/AB5CD2_mC72_15_f_5f_f_2f



Prototype	:	$AlO_5(OH)Si_2$
AFLOW prototype label	:	AB5CD2_mC72_15_f_5f_f_2f
***Strukturbericht* designation**	:	$S5_6$
Pearson symbol	:	mC72
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=AB5CD2_mC72_15_f_5f_f_2f --params=`$a, b/a, c/a, \beta, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9$

Other compounds with this structure

- $Mg_3Si_4O_{10}(OH)_2$ (talc)

- This a double-layer version of the pyrophyllite structure. (Brindley, 1259) has shown that some samples have only one layer, with a corresponding reduction in the c lattice vector. Both Brindley and (Lee, 1981) found pyrophyllite samples with space group $P\bar{1}$ #2.
- Talc ($Mg_3Si_4O_{10}(OH)_2$) is isostructural with pyrophyllite, with magnesium replacing aluminum on the ($8f$) site and the addition of another magnesium atom on the ($4a$) Wyckoff site.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$

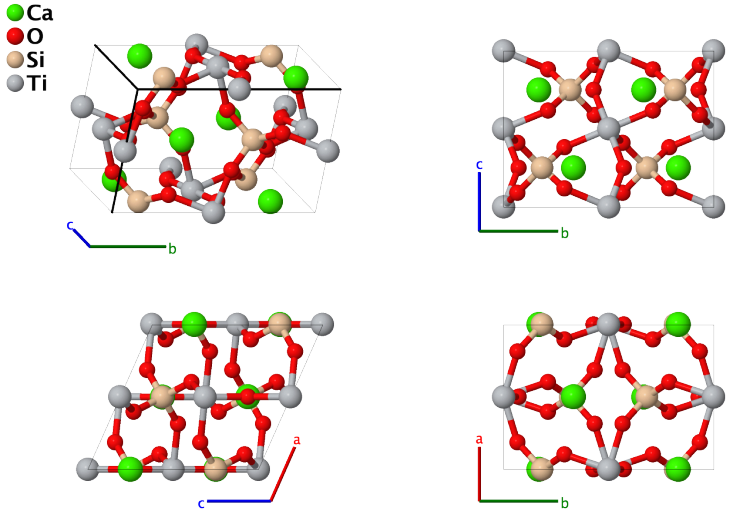
Titanite ($CaTiSiO_5$, $S0_6$) Structure: AB5CD_mC32_15_e_e2f_e_b

http://aflow.org/prototype-encyclopedia/AB5CD_mC32_15_e_e2f_e_b

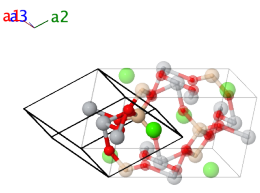


Prototype	:	CaO_5SiTi
AFLOW prototype label	:	AB5CD_mC32_15_e_e2f_e_b
***Strukturbericht* designation**	:	$S0_6$
Pearson symbol	:	mC32
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=AB5CD_mC32_15_e_e2f_e_b --params=`$a, b/a, c/a, \beta, y_2, y_3, y_4, x_5, y_5, z_5, x_6, y_6, z_6$

- We use the data from sample M28658 to construct our titanite cell.
- (Hermann, 1937) places the titanium atoms at the (4*c*) Wyckoff position rather than the (4*b*) position favored by (Hawthorne, 1991). The biggest difference between the two structures is the distance between the silicon and titanium atoms, which is 3.81 Å in Hawthorne and a rather short 2 Å in Hermann. We therefore favor the Hawthorne structure, and, since it does not otherwise substantially change the results, we continue to use $S0_6$ to describe it.
- (Hermann, 1937) also listed this as the $H5_6$ structure in the index.

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

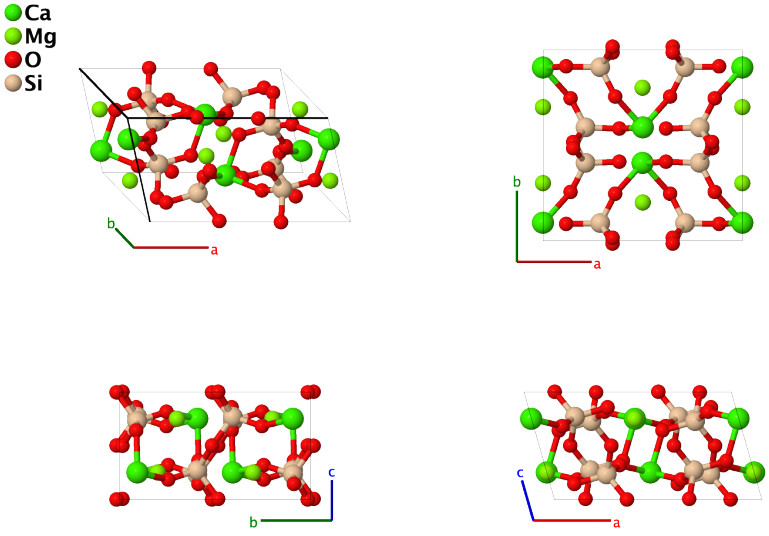
Diopside [$CaMg(SiO_3)_2$, $S4_1$] Structure: ABC6D2_mC40_15_e_e_3f_f

http://aflow.org/prototype-encyclopedia/ABC6D2_mC40_15_e_e_3f_f.S4_1



Prototype	:	$CaMgO_6Si_2$
AFLOW prototype label	:	ABC6D2_mC40_15_e_e_3f_f
***Strukturbericht* designation**	:	$S4_1$
Pearson symbol	:	mC40
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=ABC6D2_mC40_15_e_e_3f_f --params=`$a, b/a, c/a, \beta, y_1, y_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

Other compounds with this structure

- (Ca,Na)(Mg,Fe,Al,Ti)(Si,Al)$_2$O$_6$ (augite)

- (Finger, 1976) list the two ($4e$) positions as 'M1' and 'M2', and both are mixtures of calcium and magnesium. For visual clarity we desigated the first ($4e$) position as calcium and the second as magnesium.
- This structure has the same AFLOW label as esseneite. The structures are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.

Base-centered Monoclinic primitive vectors:

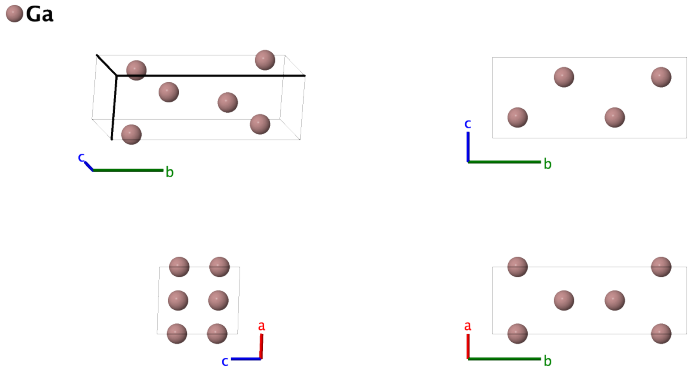
β-Ga (*obsolete*) Structure: A_mC4_15_e

http://aflow.org/prototype-encyclopedia/A_mC4_15_e

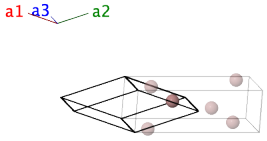


Prototype	:	Ga
AFLOW prototype label	:	A_mC4_15_e
***Strukturbericht* designation**	:	None
Pearson symbol	:	mC4
Space group number	:	15
Space group symbol	:	$C2/c$
AFLOW prototype command	:	`aflow --proto=A_mC4_15_e --params=`$a, b/a, c/a, \beta, y_1$

- β-Ga was proposed as a metastable structure of gallium, visible for short times at atomospheric pressure. The true high-pressure structure of gallium is isostructural with indium (*A*6).

Base-centered Monoclinic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\cos\beta\,\hat{\mathbf{x}} + c\sin\beta\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$-y_1\,\mathbf{a}_1 + y_1\,\mathbf{a}_2 + \frac{1}{4}\,\mathbf{a}_3$	=	$\frac{1}{4}c\cos\beta\,\hat{\mathbf{x}} + y_1 b\,\hat{\mathbf{y}} + \frac{1}{4}c\sin\beta\,\hat{\mathbf{z}}$	(4*e*)	Ga
$\mathbf{B}_2$	=	$y_1\,\mathbf{a}_1 - y_1\,\mathbf{a}_2 + \frac{3}{4}\,\mathbf{a}_3$	=	$\frac{3}{4}c\cos\beta\,\hat{\mathbf{x}} - y_1 b\,\hat{\mathbf{y}} + \frac{3}{4}c\sin\beta\,\hat{\mathbf{z}}$	(4*e*)	Ga

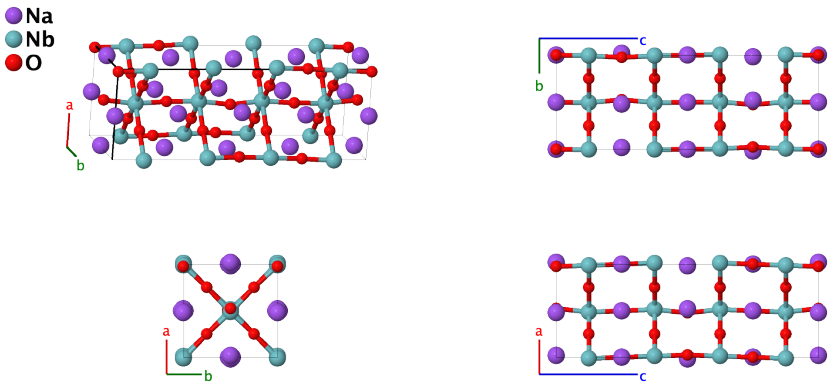
$NaNbO_3$ Structure: ABC3_oP40_17_abcd_2e_abcd4e

http://aflow.org/prototype-encyclopedia/ABC3_oP40_17_abcd_2e_abcd4e



Prototype	:	$NaNbO_3$
AFLOW prototype label	:	ABC3_oP40_17_abcd_2e_abcd4e
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP40
Space group number	:	17
Space group symbol	:	$P222_1$
AFLOW prototype command	:	`aflow --proto=ABC3_oP40_17_abcd_2e_abcd4e --params=`$a, b/a, c/a, x_1, x_2, x_3, x_4, y_5, y_6, y_7, y_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}$

- (Downs, 2003) identifies this as a "possible polymorph of Lueshite."
- If the AFLOW parameters are set to `--params=`$a, 1, \sqrt{8}, 1/2, 0, 0, 1/2, 1/2, 0, 0, 1/2, 0, 0, 3/8, 1/2, 1/2, 3/8, 1/4, 1/4, 3/8, 3/4, 1/4, 3/8, 1/4, 3/4, 3/8, 3/4, 3/4, 3/8$ then the structure is equivalent to Cubic Perovskite $E2_1$.

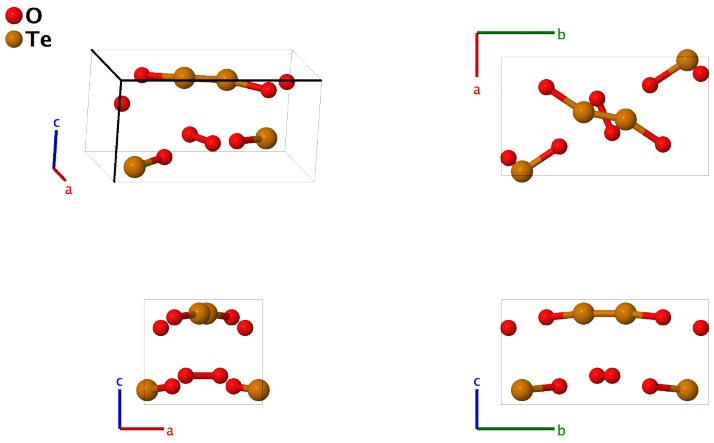
γ-TeO_2 Structure: A2B_oP12_18_2c_c

http://aflow.org/prototype-encyclopedia/A2B_oP12_18_2c_c

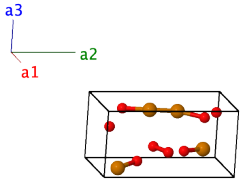


Prototype	:	O_2Te
AFLOW prototype label	:	A2B_oP12_18_2c_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP12
Space group number	:	18
Space group symbol	:	$P2_12_12$
AFLOW prototype command	:	`aflow --proto=A2B_oP12_18_2c_c --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3$

- This is a metastable state of TeO_2, similar to α-TeO_2 paratelluride. (Champarnaud-Mesjard, 2000) labels the atomic positions as being on the '($4a$)' Wyckoff position, but this does not exist for space group $P2_12_12$ #18. The atoms are actually on the general site for this space group, ($4c$).

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

AFLOW prototype command	:	`aflow --proto=A2B2C_oP20_19_2a_2a_a --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5$

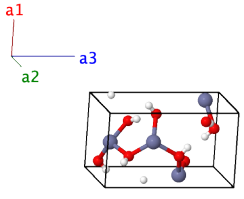
Other compounds with this structure

- β-$Be(OH)_2$

- (Corey, 1933) originally determined the structure of ϵ-$Zn(OH)_2$, but they were unable to locate the hydrogen atoms. This structure was given the *Strukturbericht* designation $C31$ by (Gottfried, 1937). (Stahl, 1998) located the hydrogen atoms, and found that they did not change the space group, so we use the updated structure as our $C31$ prototype.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

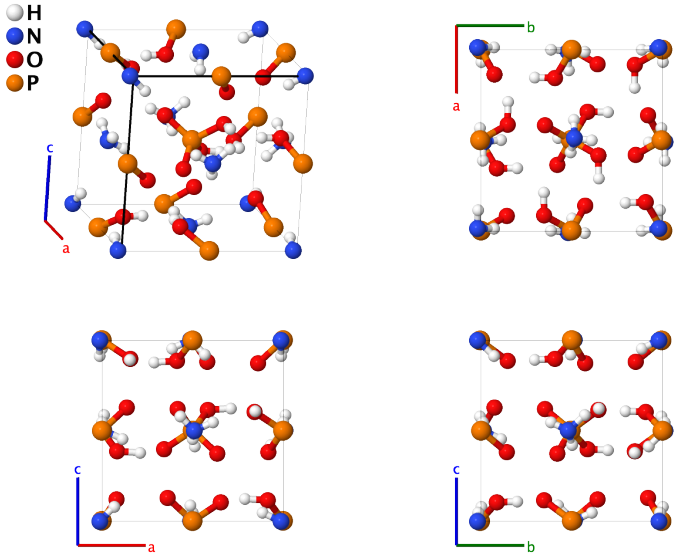
Ferroelectric $NH_4H_2PO_4$ Structure: A6BC4D_oP48_19_6a_a_4a_a

http://aflow.org/prototype-encyclopedia/A6BC4D_oP48_19_6a_a_4a_a



Prototype	:	H_6NO_4P
AFLOW prototype label	:	A6BC4D_oP48_19_6a_a_4a_a
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP48
Space group number	:	19
Space group symbol	:	$P2_12_12_1$
AFLOW prototype command	:	`aflow --proto=A6BC4D_oP48_19_6a_a_4a_a --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}$

Other compounds with this structure

- $NH_4H_2AsO_4$

- Below 148 K, $NH_4H_2PO_4$ undergoes a transition from a tetragonal paraelectric phase to this orthorhombic ferroelectric phase. This seems to occur because the hydrogen atoms associated with the PO_4 ions become frozen into place.
- The data for this structure was taken at 143 K.

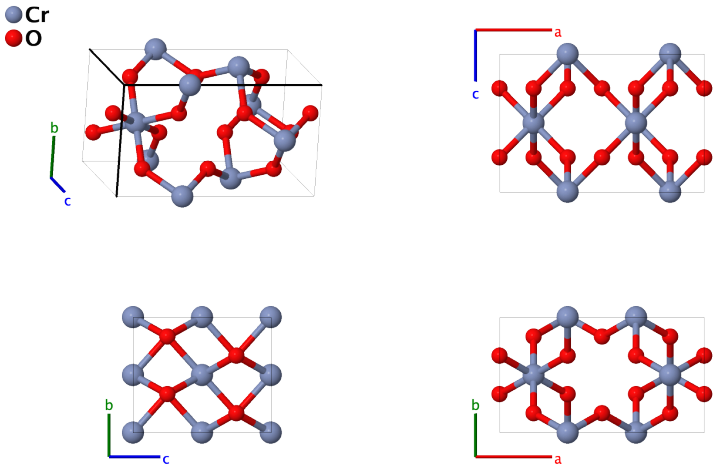
$D0_7$ (CrO_3) (*obsolete*) Structure: AB3_oC16_20_a_bc

http://aflow.org/prototype-encyclopedia/AB3_oC16_20_a_bc

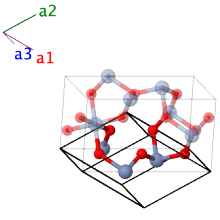


Prototype	:	CrO_3
AFLOW prototype label	:	AB3_oC16_20_a_bc
***Strukturbericht* designation**	:	$D0_7$
Pearson symbol	:	oC16
Space group number	:	20
Space group symbol	:	$C222_1$
AFLOW prototype command	:	`aflow --proto=AB3_oC16_20_a_bc --params=`$a, b/a, c/a, x_1, y_2, x_3, y_3, z_3$

- This is the determination of the orthorhombic structure of CrO_3 given the $D0_7$ designation by (Hermann, 1937). This structure is superceded by the one found by (Byström, 1950), which we call the "orthorhombic CrO_3 phase,". The current structure has the Cr atom at the center of a distorted oxygen octahedron, while the newer structure has the Cr atom at center of a distorted tetrahedron.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$x_1\,\mathbf{a}_1 + x_1\,\mathbf{a}_2$	=	$x_1 a\,\hat{\mathbf{x}}$	$(4a)$	Cr
$\mathbf{B}_2$	=	$-x_1\,\mathbf{a}_1 - x_1\,\mathbf{a}_2 + \frac{1}{2}\,\mathbf{a}_3$	=	$-x_1 a\,\hat{\mathbf{x}} + \frac{1}{2}c\,\hat{\mathbf{z}}$	$(4a)$	Cr

$\mathbf{B}_3$	=	$-y_2\,\mathbf{a}_1 + y_2\,\mathbf{a}_2 + \frac{1}{4}\,\mathbf{a}_3$	=	$y_2 b\,\hat{\mathbf{y}} + \frac{1}{4}c\,\hat{\mathbf{z}}$	(4*b*)	O I
$\mathbf{B}_4$	=	$y_2\,\mathbf{a}_1 - y_2\,\mathbf{a}_2 + \frac{3}{4}\,\mathbf{a}_3$	=	$-y_2 b\,\hat{\mathbf{y}} + \frac{3}{4}c\,\hat{\mathbf{z}}$	(4*b*)	O I
$\mathbf{B}_5$	=	$(x_3 - y_3)\,\mathbf{a}_1 + (x_3 + y_3)\,\mathbf{a}_2 + z_3\,\mathbf{a}_3$	=	$x_3 a\,\hat{\mathbf{x}} + y_3 b\,\hat{\mathbf{y}} + z_3 c\,\hat{\mathbf{z}}$	(8*c*)	O II
$\mathbf{B}_6$	=	$(-x_3 + y_3)\,\mathbf{a}_1 + (-x_3 - y_3)\,\mathbf{a}_2 + \left(\frac{1}{2} + z_3\right)\mathbf{a}_3$	=	$-x_3 a\,\hat{\mathbf{x}} - y_3 b\,\hat{\mathbf{y}} + \left(\frac{1}{2} + z_3\right)c\,\hat{\mathbf{z}}$	(8*c*)	O II
$\mathbf{B}_7$	=	$(-x_3 - y_3)\,\mathbf{a}_1 + (-x_3 + y_3)\,\mathbf{a}_2 + \left(\frac{1}{2} - z_3\right)\mathbf{a}_3$	=	$-x_3 a\,\hat{\mathbf{x}} + y_3 b\,\hat{\mathbf{y}} + \left(\frac{1}{2} - z_3\right)c\,\hat{\mathbf{z}}$	(8*c*)	O II
$\mathbf{B}_8$	=	$(x_3 + y_3)\,\mathbf{a}_1 + (x_3 - y_3)\,\mathbf{a}_2 - z_3\,\mathbf{a}_3$	=	$x_3 a\,\hat{\mathbf{x}} - y_3 b\,\hat{\mathbf{y}} - z_3 c\,\hat{\mathbf{z}}$	(8*c*)	O II

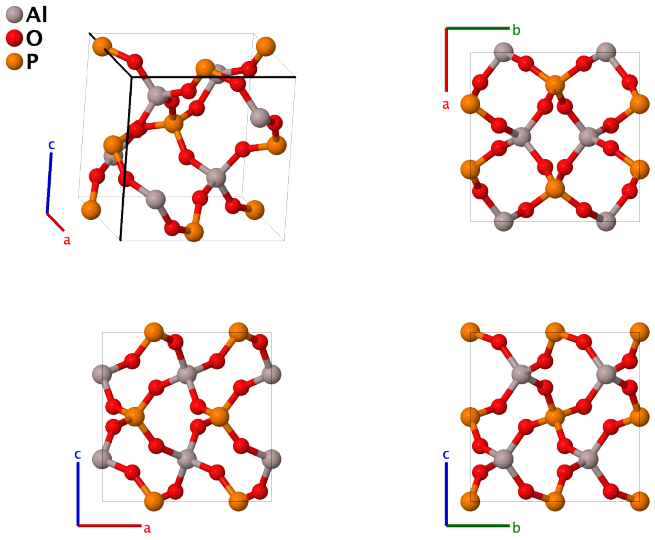
$AlPO_4$ "low cristobalite type" Structure: AB4C_oC24_20_b_2c_a

http://aflow.org/prototype-encyclopedia/AB4C_oC24_20_b_2c_a



Prototype	:	AlO_4P
AFLOW prototype label	:	AB4C_oC24_20_b_2c_a
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC24
Space group number	:	20
Space group symbol	:	$C222_1$
AFLOW prototype command	:	`aflow --proto=AB4C_oC24_20_b_2c_a --params=`$a, b/a, c/a, x_1, y_2, x_3, y_3, z_3, x_4, y_4, z_4$

Other compounds with this structure

- $GaPO_4$

- Aluminum and Gallium Phosphate are closely related to the low cristobalite structure of SiO_2.
- The change in symmetry from $Fd\bar{3}m$ in SiO_2 to $C222_1$ in $AlPO_4$ is caused by the replacement of the silicon atoms by two types of atoms.
- The structure is "pseudo-tetragonal", with $a = b$, but the presence of ordered aluminum and phosphorus atoms reduces the symmetry to orthogonal.

Base-centered Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

- There are several problems with this structure:
- First, (Brosset, 1937) gives coordinates $y_3 = -y_2$, which gives the structure an inversion site and makes the space group *Cmcm*. We have adjusted the coordinates of the third atom slightly to avoid this.
- Second, (Molinier, 1993) makes the argument that the structure observed by Brosset is actually $Tl_2AlF_5{\cdot}H_2O$.
- Finally, (Pabst, 1950) indicates that a 1942 work of Brosset refines the structure, but we have not been able to access this paper in any form, nor have we found any reference to this structure in the literature.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$

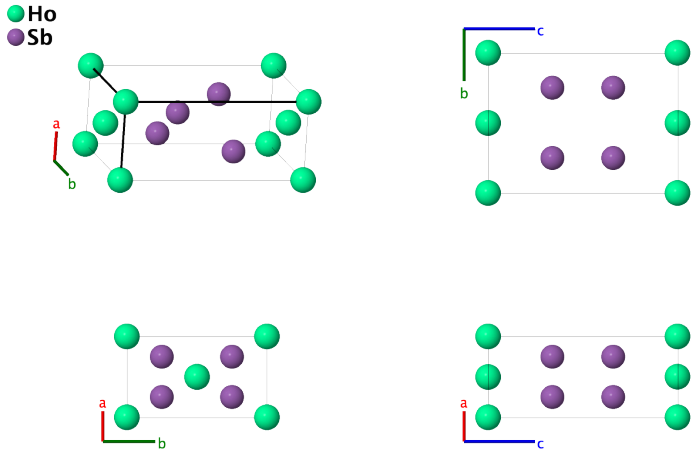
$HoSb_2$ Structure: AB2_oC6_21_a_k

http://aflow.org/prototype-encyclopedia/AB2_oC6_21_a_k.HoSb2



Prototype	:	$HoSb_2$
AFLOW prototype label	:	AB2_oC6_21_a_k
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC6
Space group number	:	21
Space group symbol	:	$C222$
AFLOW prototype command	:	`aflow --proto=AB2_oC6_21_a_k --params=`$a, b/a, c/a, z_2$

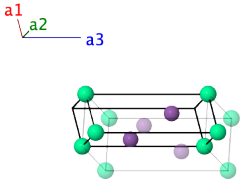
Other compounds with this structure

- $LuSb_2$, YSb_2, $DySb_2$ (HT), $GdSb_2$ (HT), and $TbSb_2$ (HT)

- Measurements were performed at a pressure of 65 kbar.
- The primitive unit cell is nearly hexagonal.
- The author states "We are well aware of the fact that the structure presented here may indeed be only a subcell of the true structure."
- $HoSb_2$ and Ta_2H share the same AFLOW prototype label, AB2_oC6_21_a_k. The structures are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	($2a$)	Ho
$\mathbf{B}_2$	=	$\frac{1}{2}\,\mathbf{a}_2 + z_2\,\mathbf{a}_3$	=	$\frac{1}{4}a\,\hat{\mathbf{x}} + \frac{1}{4}b\,\hat{\mathbf{y}} + z_2 c\,\hat{\mathbf{z}}$	($4k$)	Sb
$\mathbf{B}_3$	=	$\frac{1}{2}\,\mathbf{a}_1 - z_2\,\mathbf{a}_3$	=	$\frac{1}{4}a\,\hat{\mathbf{x}} - \frac{1}{4}b\,\hat{\mathbf{y}} - z_2 c\,\hat{\mathbf{z}}$	($4k$)	Sb

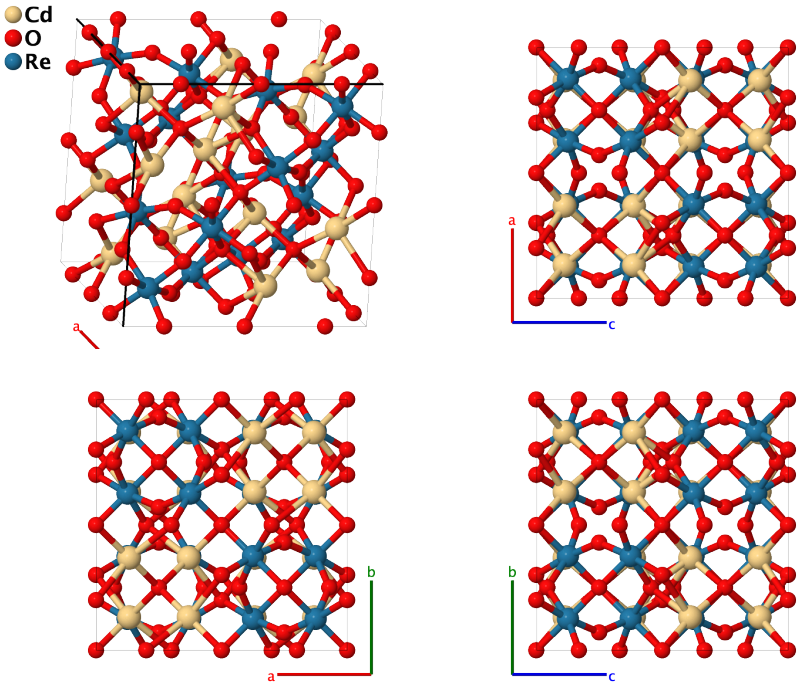
Predicted Phase IV $Cd_2Re_2O_7$ Structure: A2B7C2_oF88_22_k_bdefghij_k

http://aflow.org/prototype-encyclopedia/A2B7C2_oF88_22_k_bdefghij_k



Prototype	:	$Cd_2O_7Re_2$
AFLOW prototype label	:	A2B7C2_oF88_22_k_bdefghij_k
***Strukturbericht* designation**	:	None
Pearson symbol	:	oF88
Space group number	:	22
Space group symbol	:	$F222$
AFLOW prototype command	:	`aflow --proto=A2B7C2_oF88_22_k_bdefghij_k --params=`$a, b/a, c/a, x_3, y_4, z_5, z_6, y_7, x_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}$

- $Cd_2Re_2O_7$ exhibits a number of phases. We will use the notation of (Kapcia, 2019) to describe them:
  - Phase I: above 200 K, the system takes on the cubic pyrochlore ($E8_1$) structure.
  - Phase II: in the range 120-200 K the system is in the tetragonal $I\bar{4}m2$ #119 structure.
  - Phase III: in the range 80-120 K the system is in the tetragonal $I4_122$ #98 structure.
  - Phase IV: (Kapcia, 2019) did a first-principles study of this system and found that below 80 K Phase III develops a soft phonon mode which transforms the system into an orthorhombic $F222$ #22 structure. (This structure)
  - (Norman, 2019) points out that both Phase III and Phase IV structures have issues.
- Phase IV is extremely close to Phase II. If AFLOW-SYM and FINDSYM allow symmetry tolerances of 0.002 Å, the orthorhombic phase becomes tetragonal.

Face-centered Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\end{aligned}$$

- The alums have the general formula $AB(XO_4)_2{\cdot}12H_2O$, where A is a monovalent ion, B is a trivalent ion, and X is a chalcogen. In most cases atom B is aluminum and atom X is sulfur, leading to the name alum.
- All alums have their room-temperature form in space group $Pa\bar{3}$ #205, but the bonding between the A and B ions and the XO_4 complex can be quite different.

- (Lipson, 1935ab) described three general forms of alum based on the sizes of the monovalent ions. Each of these forms was given a *Strukturbericht* designation by (Gottfried, 1937):
  - α-alum, with intermediate sized ions, prototype $KAl(SO_4)_2{\cdot}12H_2O$, $H4_{13}$,
  - β-alum, with large ions, prototype $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$, $H4_{14}$, and
  - γ-alum, with small ions, prototype $NaAl(SO_4)_2{\cdot}12H_2O$, $H4_{15}$.
- This classification scheme is not complete, *e.g.*, (Ledsham, 1968) points out that $NaCr(SO_4)_2{\cdot}12H_2O$ does not fit into any of these categories, and that the actual structure depends on the combination of monovalent and trivalent ions.
- As noted above, the $Pa\overline{3}$ structures of alum are the room temperature form. As the temperature decreases the alum structure may transform. For example, in the temperature range 150-170 K, the β-alum $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$ transforms into this orthorhombic structure with fully ordered NH_3CH_3 ions.
- The data presented here was taken at 113 K.

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

Prototype	:	$Al_{13}Co_4$
AFLOW prototype label	:	A13B4_oP102_31_17a11b_8a2b
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP102
Space group number	:	31
Space group symbol	:	$Pmn2_1$
AFLOW prototype command	:	`aflow --proto=A13B4_oP102_31_17a11b_8a2b --params=`$a, b/a, c/a, y_1, z_1, y_2, z_2, y_3, z_3, y_4, z_4, y_5, z_5, y_6, z_6, y_7, z_7, y_8, z_8, y_9, z_9, y_{10}, z_{10}, y_{11}, z_{11}, y_{12}, z_{12}, y_{13}, z_{13}, y_{14}, z_{14}, y_{15}, z_{15}, y_{16}, z_{16}, y_{17}, z_{17}, y_{18}, z_{18}, y_{19}, z_{19}, y_{20}, z_{20}, y_{21}, z_{21}, y_{22}, z_{22}, y_{23}, z_{23}, y_{24}, z_{24}, y_{25}, z_{25}, x_{26}, y_{26}, z_{26}, x_{27}, y_{27}, z_{27}, x_{28}, y_{28}, z_{28}, x_{29}, y_{29}, z_{29}, x_{30}, y_{30}, z_{30}, x_{31}, y_{31}, z_{31}, x_{32}, y_{32}, z_{32}, x_{33}, y_{33}, z_{33}, x_{34}, y_{34}, z_{34}, x_{35}, y_{35}, z_{35}, x_{36}, y_{36}, z_{36}, x_{37}, y_{37}, z_{37}, x_{38}, y_{38}, z_{38}$

- Space group $Pmn2_1$ #31 allows an arbitrary choice for the origin of the z-axis. We follow (Grin, 1994) and set the $z_{25} = 0$.
- If we allow a tolerance of 0.25 Å for AFLOW-SYM and 0.6 Å in the atomic positions for FINDSYM, the symmetry is classified as *Pnnm* #58.

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

- (Gottfried, 1937) writes $z_{13} = 0.408$ for the coordinate of the (H_2O-II) molecule, but West uses $z_{13} = 0$, which gives a symmetric arrangement of water molecules around the chlorine atom. We use West's value here.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

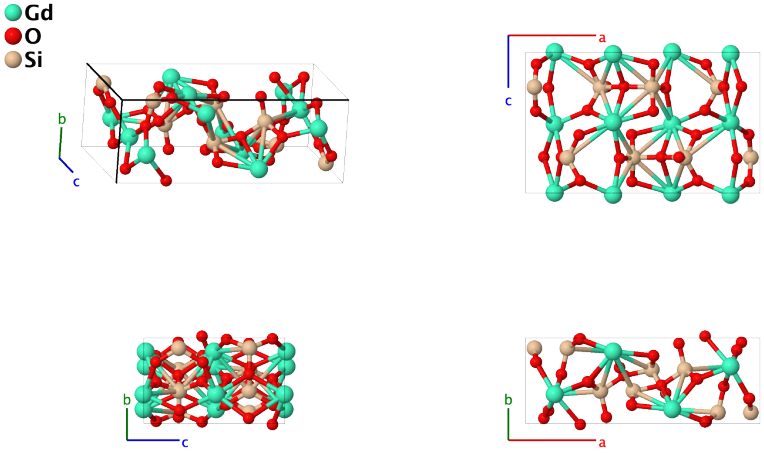
Possible δ-$Gd_2Si_2O_7$ Structure: A2B7C2_oP44_33_2a_7a_2a

http://aflow.org/prototype-encyclopedia/A2B7C2_oP44_33_2a_7a_2a



Prototype	:	$Gd_2O_7Si_2$
AFLOW prototype label	:	A2B7C2_oP44_33_2a_7a_2a
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP44
Space group number	:	33
Space group symbol	:	$Pna2_1$
AFLOW prototype command	:	`aflow --proto=A2B7C2_oP44_33_2a_7a_2a --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}$

Other compounds with this structure

- δ-$Ho_2O_7Si_2$, δ-$Dy_2O_7Si_2$, and δ-$Y_2O_7Si_2$

- (Smolin, 1970) found that some structures of $RE_2O_7Si_2$ (RE = Ho, Dy, Gd, Y) were in the orthorhombic $Pna2_1$ #33 space group, in which case this would be the prototype of δ-$RE_2O_7Si_2$ (Becerro, 2004). However, (Dias, 1990) found δ-$Y_2O_7Si_2$ to be in the centro-symmetric *Pnma* #62 space group. This was supported by (Becerro, 2004), who found only one yttrium site in the δ-structure. In addition, if we allow a small amount of uncertainty (0.2 Å) in positions, AFLOW-SYM and FINDSYM place this structure in the *Pnma* group. Nevertheless we have found no work explicitly stating that the structure of (Smolin, 1970) is in error, and indeed (Christensen, 1994) found δ-$Y_2O_7Si_2$ in space group $Pna2_1$. Given this ambiguity, we list $Gd_2O_7Si_2$ as a possible prototype for the δ-phase pyrosilicates.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

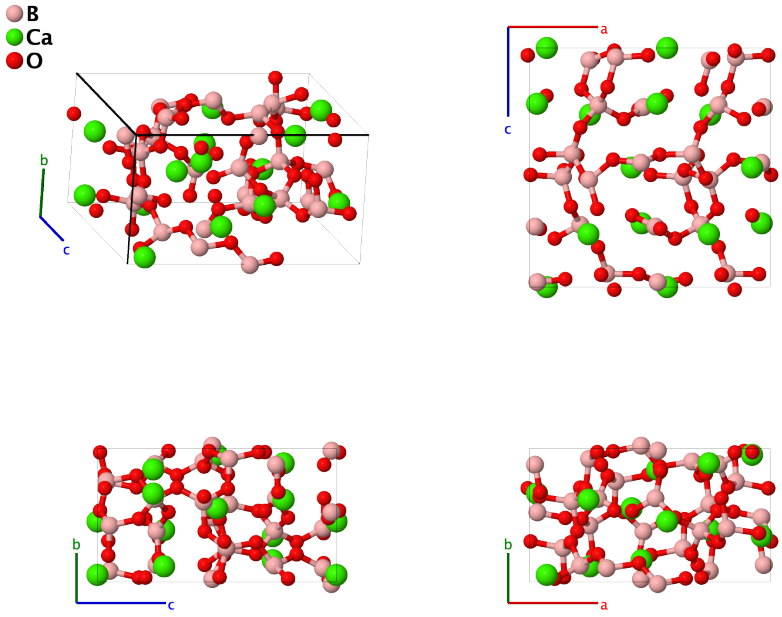
CaB_2O_4 (III) Structure: A2BC4_oP84_33_6a_3a_12a

http://aflow.org/prototype-encyclopedia/A2BC4_oP84_33_6a_3a_12a



Prototype	:	B_2CaO_4
AFLOW prototype label	:	A2BC4_oP84_33_6a_3a_12a
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP84
Space group number	:	33
Space group symbol	:	$Pna2_1$
AFLOW prototype command	:	`aflow --proto=A2BC4_oP84_33_6a_3a_12a --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}, x_{18}, y_{18}, z_{18}, x_{19}, y_{19}, z_{19}, x_{20}, y_{20}, z_{20}, x_{21}, y_{21}, z_{21}$

- CaB_2O_4 exists in at least four phases (Marezio, 1969):
- I - The ground state, stable below 1.2 GPa, *Strukturbericht* $E3_2$.
- II – Orthorhombic high pressure structure, stable between 1.2 and 1.5 GPa, presumably calciborite.
- III – Orthorhombic high pressure structure, stable between 1.5 and 2.5 GPa (this structure).
- IV – Cubic high pressure structure, stable between 2.5 and 4.0 GPa.

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

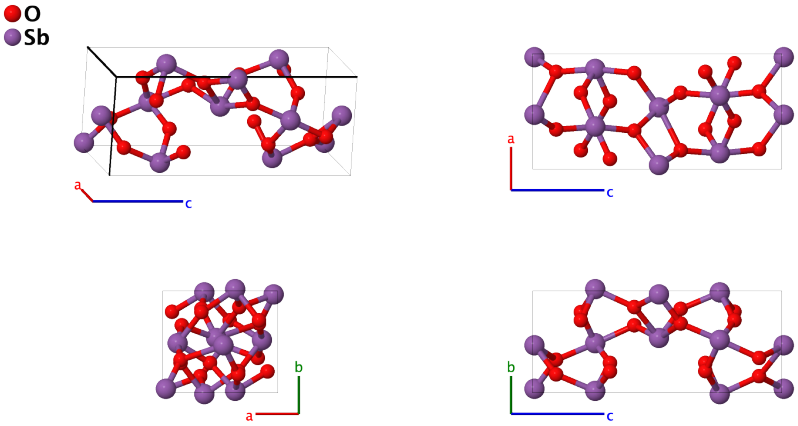
Cervantite (α-Sb_2O_4) Structure: A2B_oP24_33_4a_2a

http://aflow.org/prototype-encyclopedia/A2B_oP24_33_4a_2a



Prototype	:	O_2Sb
AFLOW prototype label	:	A2B_oP24_33_4a_2a
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP24
Space group number	:	33
Space group symbol	:	$Pna2_1$
AFLOW prototype command	:	`aflow --proto=A2B_oP24_33_4a_2a --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

Other compounds with this structure

- $SbNbO_4$

- This is *not* the $D6_2$ structure of SbO_2, which was found to be incorrect (Thornton, 1977). There is also a naturally occurring monoclinic modification of cervantite, clinocervantite (β-Sb_2O_4).

Simple Orthorhombic primitive vectors:

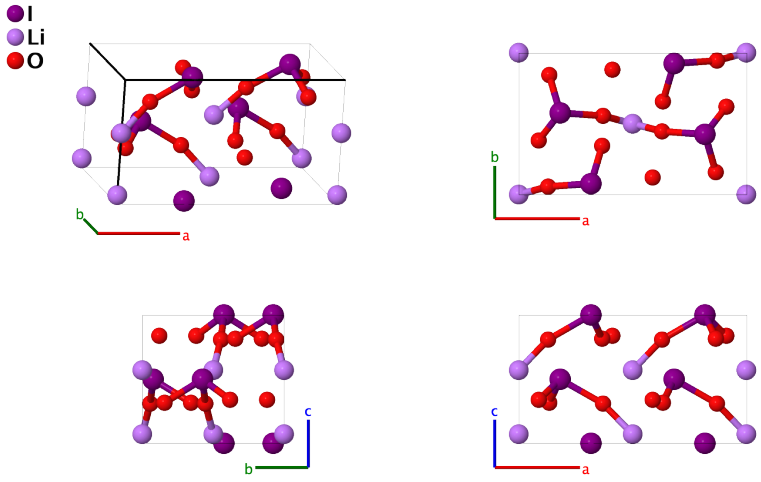
γ-$LiIO_3$ Structure: ABC3_oP20_33_a_a_3a

http://aflow.org/prototype-encyclopedia/ABC3_oP20_33_a_a_3a



Prototype	:	$ILiO_3$
AFLOW prototype label	:	ABC3_oP20_33_a_a_3a
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP20
Space group number	:	33
Space group symbol	:	$Pna2_1$
AFLOW prototype command	:	`aflow --proto=ABC3_oP20_33_a_a_3a --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5$

- $LiIO_3$ is known to exist in three forms:
  - α-$LiIO_3$, stable below 473 K: (Zachariasen, 1931) originally determined that the structure of α-$LiIO_3$ was in space group $P6_322$ #182, which (Hermann, 1937) designated *Strukturbericht* $E2_3$. (Rosenzweig, 1966) subsequently determined that the true structure was in space group $P6_3$ #173.
  - β-$LiIO_3$, stable from 573 K up to the melting point at 708 K.
  - γ-$LiIO_3$, stable between the α- and β-phases. Here we show the structure at 515 K.
- Space group $Pna2_1$ #33 allows an arbitary choice of the zero of the z-axis. Here we set $z_1 = 0$ for iodine.

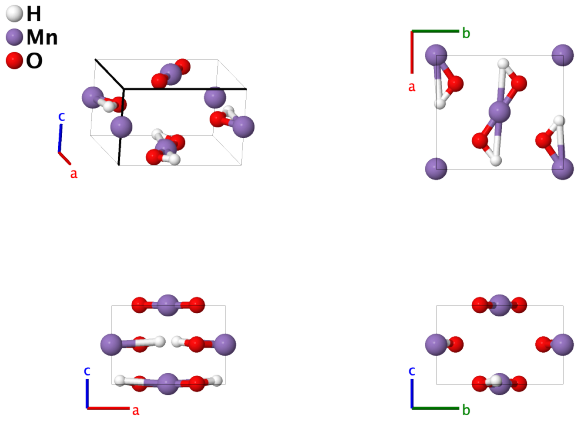
$MnF_{2-x}(OH)_x$ Structure: A2BC2_oP10_34_c_a_c

http://aflow.org/prototype-encyclopedia/A2BC2_oP10_34_c_a_c

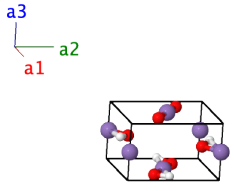


Prototype	:	$F_{2-x}H_xMnO_x$
AFLOW prototype label	:	A2BC2_oP10_34_c_a_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP10
Space group number	:	34
Space group symbol	:	*Pnn*2
AFLOW prototype command	:	`aflow --proto=A2BC2_oP10_34_c_a_c --params=`$a, b/a, c/a, z_1, x_2, y_2, z_2, x_3, y_3, z_3$

- We use the data (Yahia, 2013) give for the site occupancy of oxygen and hydrogen (0.399). The oxygen ($4c$) atom can be replaced by fluorine, in which case the hydrogen ($4c$) atom is not present. Approximately 80% of the first ($4c$) site is oxygen, with the remainder being hydrogen.
- Space group *Pnn*2 #34 allows an arbitrary choice of the origin of the z-coordinate. Here we use this to put the manganese atom at the origin, setting $z_1 = 0$.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

AFLOW prototype command	:	`aflow --proto=A4B7C2D2_oC60_36_2b_a3b_2a_b --params=`$a, b/a, c/a, y_1, z_1, y_2, z_2, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9$

- All sources agree that the space group for Bertrandite is $Cmc2_1$ #36 but differ slightly in details. We have chosen to use (Hazen, 1986) as the prototype over (Ito, 1932), which was originally designated $S4_6$, and (Solov'eva, 1965), which has unrealistically large Be-O distances.
- No paper locates the hydrogen atoms in the hydroxide ions, which may indicate that these ions can freely rotate.
- We use the data taken at 1 atmosphere.

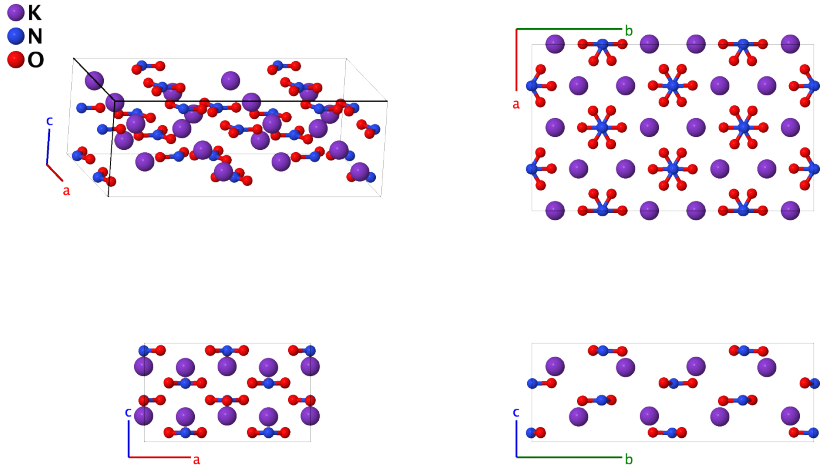
α-Potassium Nitrate (KNO_3) II Structure: ABC3_oC80_36_2ab_2ab_2a5b

http://aflow.org/prototype-encyclopedia/ABC3_oC80_36_2ab_2ab_2a5b



Prototype	:	KNO_3
AFLOW prototype label	:	ABC3_oC80_36_2ab_2ab_2a5b
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC80
Space group number	:	36
Space group symbol	:	$Cmc2_1$
AFLOW prototype command	:	`aflow --proto=ABC3_oC80_36_2ab_2ab_2a5b --params=`$a, b/a, c/a, y_1, z_1, y_2, z_2, y_3, z_3, y_4, z_4, y_5, z_5, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}$

- Two possible structures have been identified for α-KNO_3: (Nimmo, 1973) proposed an orthorhombic structure in space group *Pnma* #62, which we call "Structure I". (Adiwidjaja, 2003) found that structure, but also noted that it could be described by a doubling of the unit cell into a superstructure of type I, which we call "Structure II" and present on this page. It is unclear to us which structure is correct, so we present both. However, we do note that if we allow some uncertainty in the atoms of this structure, AFLOW-SYM and FINDSYM show it to be identical to Structure I.
- On heating, α-KNO_3 transforms into β-KNO_3 at 128 °C. When heated above 200°C and then cooled, the β phase transforms into the metastable ferroelectric γ-KNO_3 phase, which remains metastable at room temperature.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

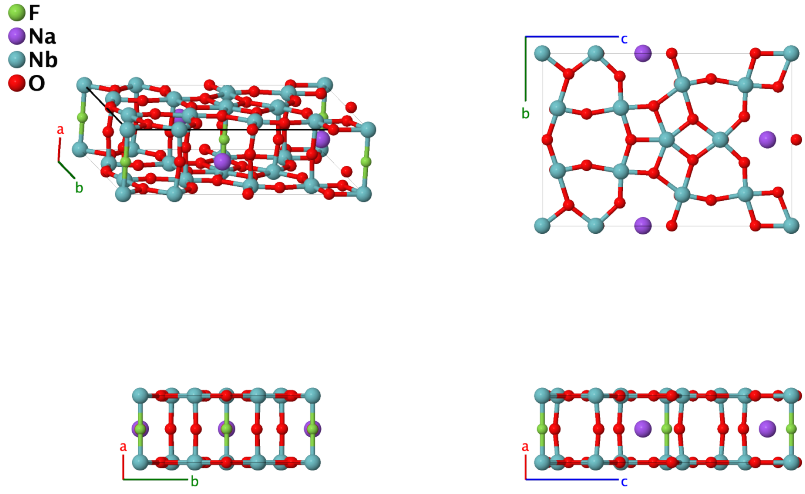
$NaNb_6O_{15}F$ Structure: ABC6D15_oC46_38_b_b_2a2d_2ab4d2e

http://aflow.org/prototype-encyclopedia/ABC6D15_oC46_38_b_b_2a2d_2ab4d2e



Prototype	:	$FNaNb_6O_{15}$
AFLOW prototype label	:	ABC6D15_oC46_38_b_b_2a2d_2ab4d2e
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC46
Space group number	:	38
Space group symbol	:	*Amm*2
AFLOW prototype command	:	`aflow --proto=ABC6D15_oC46_38_b_b_2a2d_2ab4d2e --params=`$a, b/a, c/a, z_1, z_2, z_3, z_4, z_5, z_6, z_7, y_8, z_8, y_9, z_9, y_{10}, z_{10}, y_{11}, z_{11}, y_{12}, z_{12}, y_{13}, z_{13}, y_{14}, z_{14}, y_{15}, z_{15}$

Other compounds with this structure

- $NaNb_6O_{15}(OH)$

- The x-ray scattering of an F^- ion is almost identical to that of O^{2-}, and (Andersson, 1965) was not able to distinguish between them. He arbitrarily labeled the (2*b*) site he designated as O(1) as the location of the fluorine ion and we follow this, but in reality we have no idea if the F^- ions are located on this site, are ordered on another site, or are statistically distributed on the oxygen sites. Presumably the same considerations hold for $NaNb_6O_{15}(OH)$.

- Andersson sets $z_4 = 0.159$ as the coordinate of what we label as O-II and he calls O(10), but this gives an unreasonably short distance between the Nb-II and O-II atoms, and the distances between the O-II atom and the other atoms in the structure do not agree with the distances given his paper. If we assume that the first two digits were transposed when printed, so that $z_4 = 0.519$, then we get within 0.1% of Andersson's distances.

Base-centered Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}} \\ \mathbf{a}_2 &= \tfrac{1}{2}\,b\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}} \\ \mathbf{a}_3 &= \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\end{aligned}$$

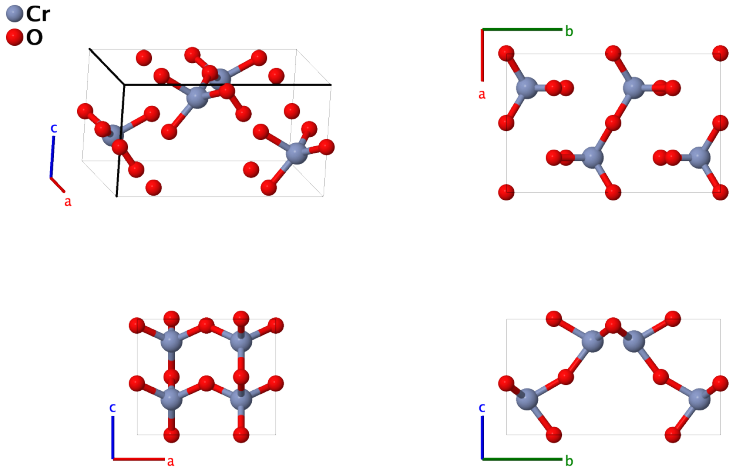
Orthorhombic CrO_3 Structure: AB3_oC16_40_b_a2b

http://aflow.org/prototype-encyclopedia/AB3_oC16_40_b_a2b

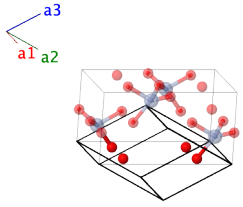


Prototype	:	CrO_3
AFLOW prototype label	:	AB3_oC16_40_b_a2b
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC16
Space group number	:	40
Space group symbol	:	*Ama*2
AFLOW prototype command	:	`aflow --proto=AB3_oC16_40_b_a2b --params=`$a, b/a, c/a, z_1, y_2, z_2, y_3, z_3, y_4, z_4$

- This is a more modern version of the $D0_7$ CrO_3 structure.
- (Byström, 1950) give this structure in the $C2cm$ setting of space group #40. We have shifted it to the standard *Ama*2 setting.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,b\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type

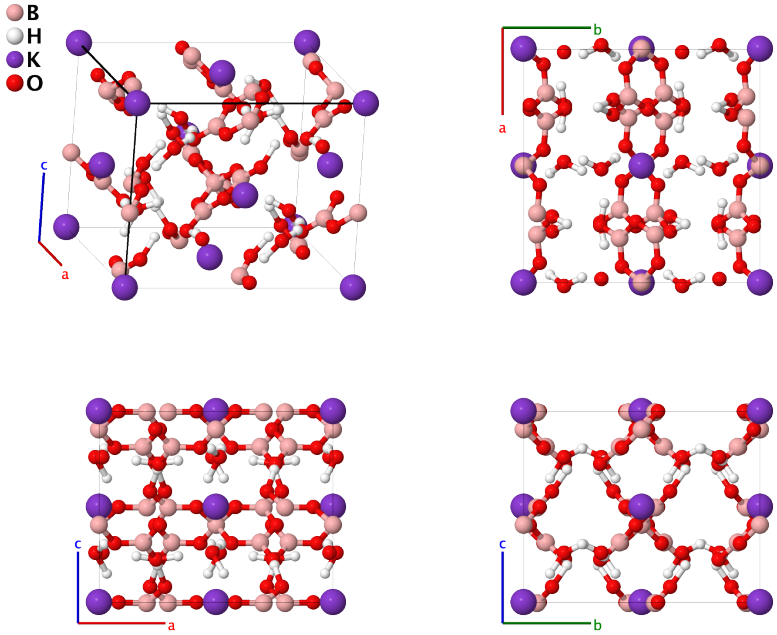
Santite ($KB_5O_8{\cdot}4H_2O$, $K3_5$) Structure: A5B8CD12_oC104_41_a2b_4b_a_6b

http://aflow.org/prototype-encyclopedia/A5B8CD12_oC104_41_a2b_4b_a_6b



Prototype	:	$B_5H_8KO_{12}$
AFLOW prototype label	:	A5B8CD12_oC104_41_a2b_4b_a_6b
***Strukturbericht* designation**	:	$K3_5$
Pearson symbol	:	oC104
Space group number	:	41
Space group symbol	:	*Aba*2
AFLOW prototype command	:	`aflow --proto=A5B8CD12_oC104_41_a2b_4b_a_6b --params=`$a, b/a, c/a, z_1, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}$

- (Zachariasen, 1938) originally determined the structure of this compound, without knowing the positions of the hydrogens, but believed the structure to be correctly written as $KH_2(H_3O)_2B_5O_{10}$. (Gottfried, 1940) gave this the *Strukturbericht* designation $K3_5$. (Zachariasen, 1963) did a refinement of the structure, including the hydrogen positions, noting that the structure should properly be written $K[B_5O_6(OH)_4]{\cdot}2H_2O$. As neither the positions of the heavy atoms nor the space group have changed, we retain the $K3_5$ designation, but we give the prototype as $KB_5O_8{\cdot}4H_2O$, which seems to be the standard formula even though it is not structurally correct.

Base-centered Orthorhombic primitive vectors:

$$
\begin{aligned}
\mathbf{a}_1 &= a\,\hat{\mathbf{x}} \\
\mathbf{a}_2 &= \tfrac{1}{2}\,b\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}} \\
\mathbf{a}_3 &= \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}
\end{aligned}
$$

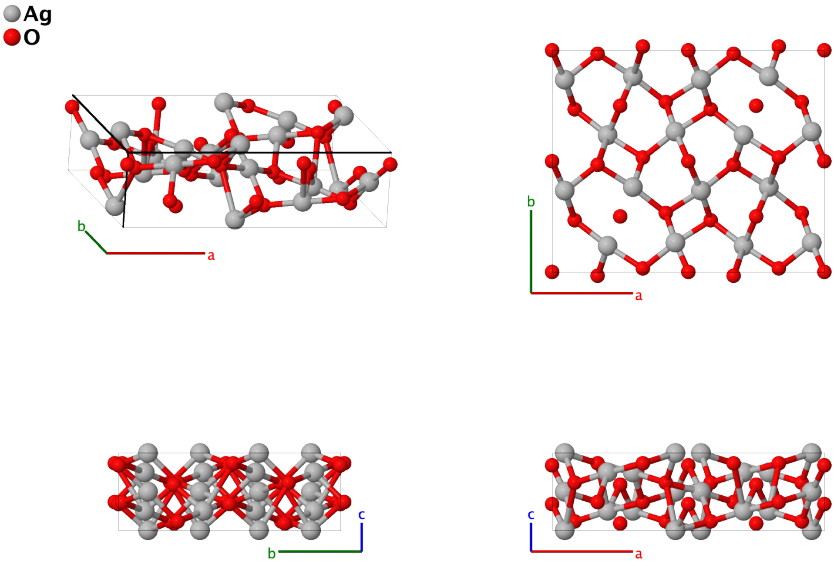
Ag_2O_3 Structure: A2B3_oF40_43_b_ab

http://aflow.org/prototype-encyclopedia/A2B3_oF40_43_b_ab



Prototype	:	Ag_2O_3
AFLOW prototype label	:	A2B3_oF40_43_b_ab
***Strukturbericht* designation**	:	None
Pearson symbol	:	oF40
Space group number	:	43
Space group symbol	:	$Fdd2$
AFLOW prototype command	:	`aflow --proto=A2B3_oF40_43_b_ab --params=`$a, b/a, c/a, z_1, x_2, y_2, z_2, x_3, y_3, z_3$

- This structure is a distortion of the $D5_5$ Ag_2O_3 structure (A3B2_cP10_224_d_b), although (Standke, 1986) does not seem to be aware of the earlier work. This is most likely closer to the correct structure for Ag_2O_3 than the $D5_5$ structure is.

Face-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,b\,\hat{\mathbf{y}} + \frac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$

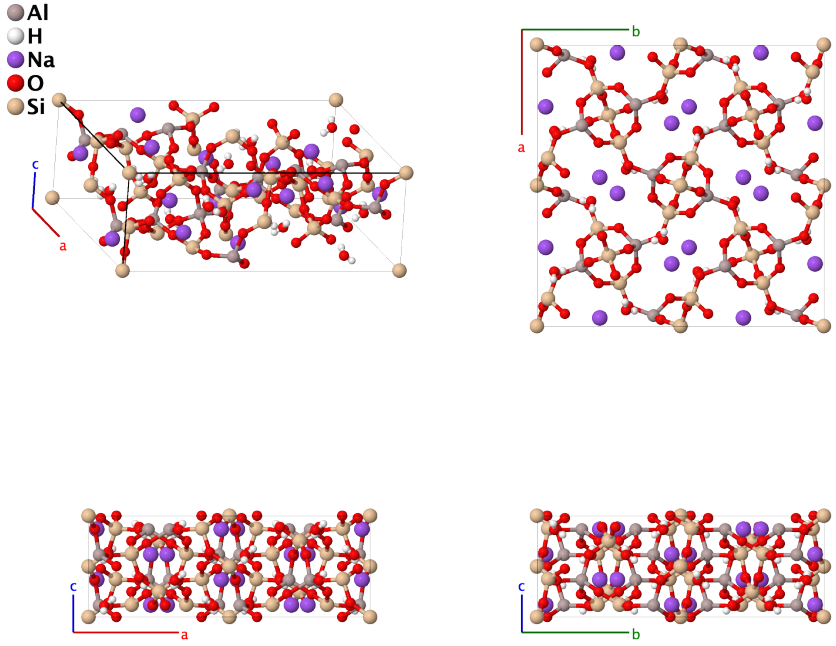
Natrolite ($Na_2Al_2Si_3O_{10}\cdot 2H_2O$, $S6_{10}$) Structure: A2B4C2D12E3_oF184_43_b_2b_b_6b_ab

http://aflow.org/prototype-encyclopedia/A2B4C2D12E3_oF184_43_b_2b_b_6b_ab



Prototype	:	$Al_2H_4Na_2O_{12}Si_3$
AFLOW prototype label	:	A2B4C2D12E3_oF184_43_b_2b_b_6b_ab
***Strukturbericht* designation**	:	$S6_{10}$
Pearson symbol	:	oF184
Space group number	:	43
Space group symbol	:	$Fdd2$
AFLOW prototype command	:	`aflow --proto=A2B4C2D12E3_oF184_43_b_2b_b_6b_ab --params=`$a, b/a, c/a, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}$

- We use the data from the sample that (Kirfel, 1984) call Crystal II. The origin has been arbitrarily set so that $z_1 = 0$.

Face-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}$$

AFLOW prototype command	:	`aflow --proto=A2B7C2_oF88_43_b_a3b_b --params=`$a, b/a, c/a, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

- This structure was given the name "blossite" by (Robinson, 1987).
- Space group $Fdd2$ #43 does not fix the $z = 0$ plane. We do this by setting $z_2 = 3/4$ for the copper atom.

Face-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,b\,\hat{\mathbf{y}} + \frac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,b\,\hat{\mathbf{y}}$$

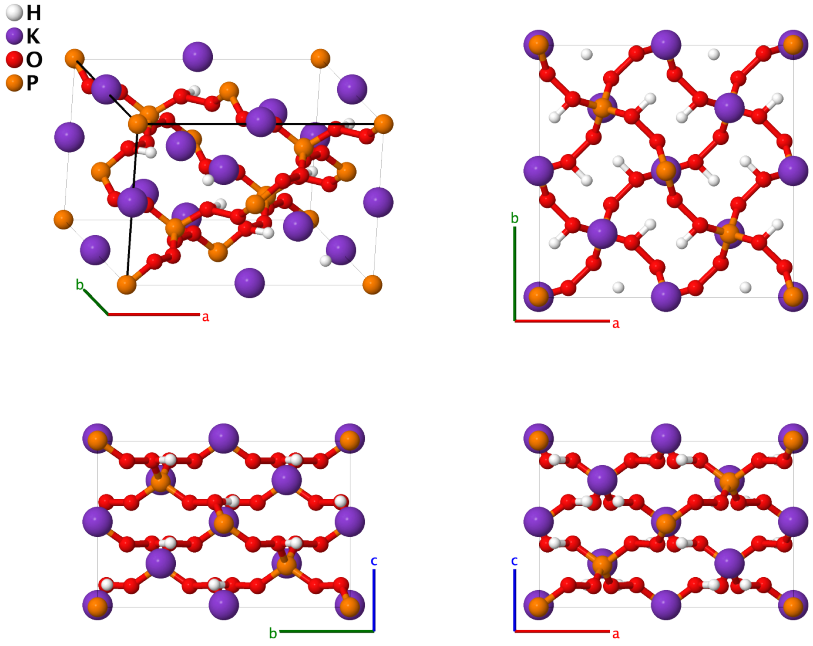
Archerite (KH_2PO_4) Structure: A2BC4D_oF64_43_b_a_2b_a

http://aflow.org/prototype-encyclopedia/A2BC4D_oF64_43_b_a_2b_a



Prototype	:	H_2KO_4P
AFLOW prototype label	:	A2BC4D_oF64_43_b_a_2b_a
***Strukturbericht* designation**	:	None
Pearson symbol	:	oF64
Space group number	:	43
Space group symbol	:	$Fdd2$
AFLOW prototype command	:	`aflow --proto=A2BC4D_oF64_43_b_a_2b_a --params=`$a, b/a, c/a, z_1, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5$

- This structure is stable below 121 K, and the data was taken at 113 K. The high temperature structure is tetragonal with disordered hydrogen (Levy, 1954).
- The origin of the z-axis is not restricted in space group $Fdd2$ #43. Here it is fixed by putting the phosphorus atom at the origin.

Face-centered Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\end{aligned}$$

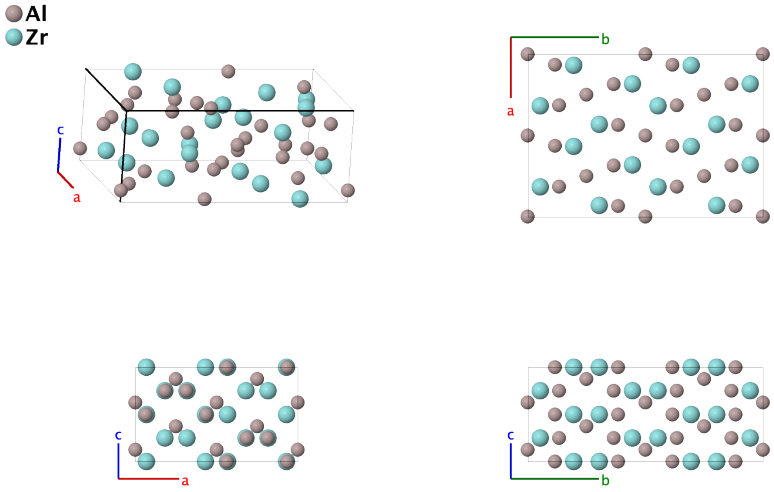
Zr_2Al_3 Structure: A3B2_oF40_43_ab_b

http://aflow.org/prototype-encyclopedia/A3B2_oF40_43_ab_b



Prototype	:	Al_3Zr_2
AFLOW prototype label	:	A3B2_oF40_43_ab_b
***Strukturbericht* designation**	:	None
Pearson symbol	:	oF40
Space group number	:	43
Space group symbol	:	$Fdd2$
AFLOW prototype command	:	`aflow --proto=A3B2_oF40_43_ab_b --params=`$a, b/a, c/a, z_1, x_2, y_2, z_2, x_3, y_3, z_3$

Other compounds with this structure

- Hf_2Al_3

- The $z = 0$ plane is not fixed in space group $Fdd2$ #43. Here it is arbitrarily chosen so that $z_3 = 0$ for the zirconium atom.

Face-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2} b\,\hat{\mathbf{y}} + \frac{1}{2} c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2} a\,\hat{\mathbf{x}} + \frac{1}{2} c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2} a\,\hat{\mathbf{x}} + \frac{1}{2} b\,\hat{\mathbf{y}}$$

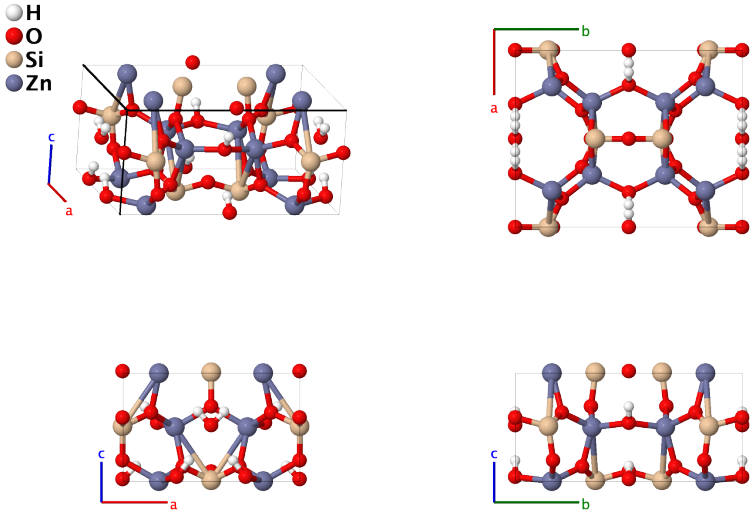
Hemimorphite ($Zn_4Si_2O_7(OH)_2{\cdot}H_2O$, $S\,2_2$) Structure: A2B5CD2_oI40_44_2c_abcde_d_e

http://aflow.org/prototype-encyclopedia/A2B5CD2_oI40_44_2c_abcde_d_e



Prototype	:	$H_2O_5SiZn_2$
AFLOW prototype label	:	A2B5CD2_oI40_44_2c_abcde_d_e
***Strukturbericht* designation**	:	$S\,2_2$
Pearson symbol	:	oI40
Space group number	:	44
Space group symbol	:	*Imm*2
AFLOW prototype command	:	`aflow --proto=A2B5CD2_oI40_44_2c_abcde_d_e --params=`$a, b/a, c/a, z_1, z_2, x_3, z_3, x_4, z_4, x_5, z_5, y_6, z_6, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9$

- The original (Ito, 1932) determination of this structure did not locate the positions of the hydrogen atoms. (Hill, 1977) were able to do this, so we use the updated structure as the prototype.
- (Hill, 1977) gives the z coordinates of the atoms on the ($2c$) sites as 0.0190, 0.0643, and 0.0410, respectively, but this gives unrealistic H-O distances. Examination of the figures and distance tables shows that we should take $z_2 = 0.190$, $z_3 = 0.643$, and $z_4 = 0.041$, a conclusion also reached by (Downs, 2003).

Body-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$

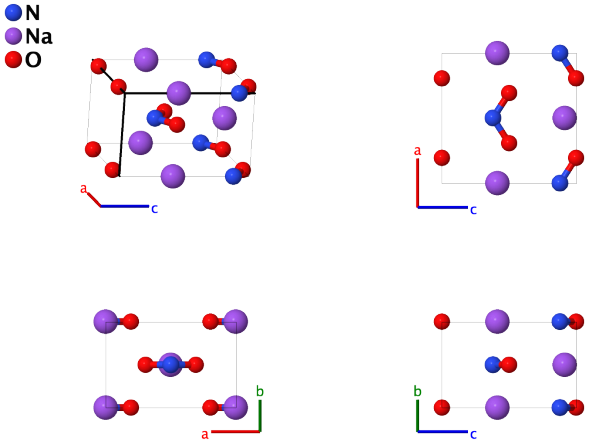
Ferroelectric $NaNO_2$ ($F5_5$) Structure: ABC2_oI8_44_a_a_c

http://aflow.org/prototype-encyclopedia/ABC2_oI8_44_a_a_c



Prototype	:	$NaNO_2$
AFLOW prototype label	:	ABC2_oI8_44_a_a_c
***Strukturbericht* designation**	:	$F5_5$
Pearson symbol	:	oI8
Space group number	:	44
Space group symbol	:	*Imm*2
AFLOW prototype command	:	`aflow --proto=ABC2_oI8_44_a_a_c --params=`$a, b/a, c/a, z_1, z_2, x_3, z_3$

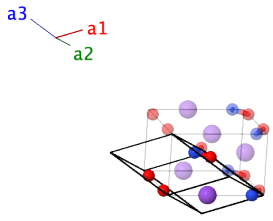
Other compounds with this structure

- $AgNO_2$ ($F5_{12}$)

- This is the low-temperature phase of $NaNO_2$. It is ferroelectric below 158°C.
- (Kay, 1961) gives the structure in the *Im*2*m* setting of space group #44. We have used FINDSYM to put it in the standard *Imm*2 setting.
- This structure is very similar to silver nitrite, $AgNO_2$, $F5_{12}$. We list the two structures as they are listed separately in the *Strukturbericht* volumes.
- The origin of the z coordinate in *Imm*2, or the y coordinate in *Im*2*m*, is arbitrary, and z_3 is set to zero.

Body-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$



Basis vectors:

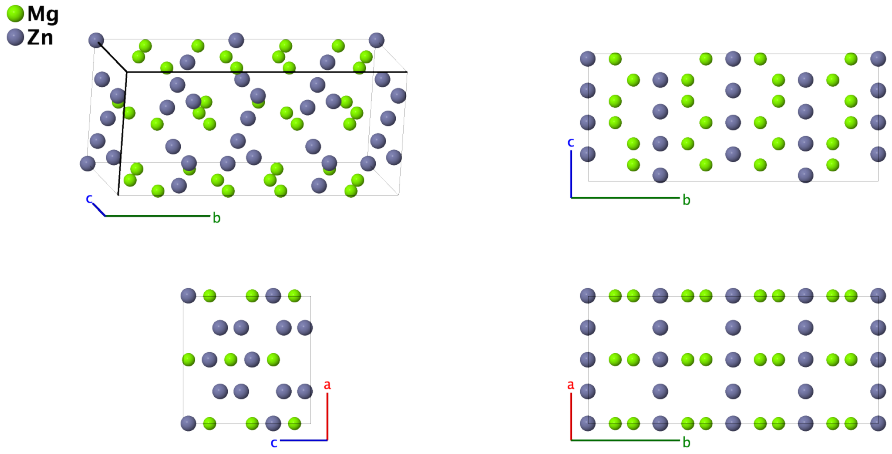
*B*30 (MgZn?) Structure: AB_oI48_44_6d_ab2cde

http://aflow.org/prototype-encyclopedia/AB_oI48_44_6d_ab2cde



Prototype	:	MgZn
AFLOW prototype label	:	AB_oI48_44_6d_ab2cde
***Strukturbericht* designation**	:	*B*30
Pearson symbol	:	oI48
Space group number	:	44
Space group symbol	:	*Imm*2
AFLOW prototype command	:	`aflow --proto=AB_oI48_44_6d_ab2cde --params=`$a, b/a, c/a, z_1, z_2, x_3, z_3, x_4, z_4, y_5, z_5, y_6, z_6, y_7, z_7, y_8, z_8, y_9, z_9, y_{10}, z_{10}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}$

- It is rather a mystery why (Hermann, 1937) gave this the *Strukturbericht* designation *B*30, as the structure presented in the literature contradicts itself. (Tarschish, 1933) derived this structure from the hexagonal Laves structure $MgZn_2$ (*C*14) by doubling the unit cell in all directions to obtain a 96 atom unit cell, replacing 16 of the zinc atoms in this structure by magnesium, and shifting the z-coordinates of these atoms by $\pm c/16$. He then states that the space group remains $P6_3/mmc$ #194. (McKeehan, 1935) pointed out that this is impossible, as the converted Mg atoms only have a two-fold rotation axis about the z-axis. He assigned the structure to space group *Pmm*2 #25. (Hermann, 1937) referenced both papers, giving the space group as $P6_3/mmc$ but listing the atomic coordinates enumerated by McKeehan. In fact, the McKeehan structure has space group *Imm*2 #44, with 48 atoms in the conventional cell, half of the original, and 24 atoms in the primitive cell. This was noted, without reference, by (Parthé, 1993), which is the only comprehensive list of *Strukturbericht* symbols to include the *B*30 structure. We have reproduced this *Imm*2 structure from McKeehan's data. The true structure of MgZn is unclear, although it is seen in the Mg-Zn binary phase diagram (Massalski, 1990) over a small range of compositions, a complete crystallographic study has never been published. It is possible that the actual structure is off-stoichiometry. There is some evidence of a $Mg_{12}Zn_{13}$ structure (Mezbahul-Islam, 2014), and $Mg_{21}Zn_{25}$ has been determined (Cerný, 2002) to have the $Zr_{21}Re_{25}$ structure. There are similar problems with the $D2_2$ $MgZn_5$ structure, which we discuss on that page.

Body-centered Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\end{aligned}$$

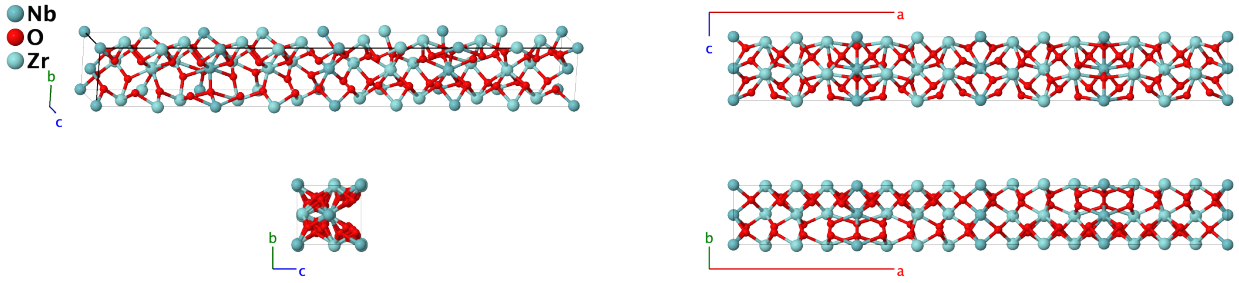
$Nb_2Zr_6O_{17}$ Structure: A2B17C6_oI100_46_ab_b8c_3c

http://aflow.org/prototype-encyclopedia/A2B17C6_oI100_46_ab_b8c_3c



Prototype	:	$Nb_2O_{17}Zr_6$
AFLOW prototype label	:	A2B17C6_oI100_46_ab_b8c_3c
***Strukturbericht* designation**	:	None
Pearson symbol	:	oI100
Space group number	:	46
Space group symbol	:	*Ima*2
AFLOW prototype command	:	`aflow --proto=A2B17C6_oI100_46_ab_b8c_3c --params=`$a, b/a, c/a, z_1, y_2, z_2, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}$

Other compounds with this structure

- $Nb_2Hf_6O_{17}$, $Nb_2Zr_6O_{17}$, $Ta_2Hf_6O_{17}$, and $Ta_2Zr_6O_{17}$

- Both (Galy, 1973) and (McCormack, 2019) state that the metallic atom sites are disordered, that is, for the prototype each metallic site has the average composition, $Nb_{0.25}Zr_{0.75}$. We place the niobium atoms on the (4*a*) and (4*b*) sites, and the zirconium on the (8*c*) sites so that the different symmetries are displayed.
- (McCormack, 2019) notes that the metallic composition of these compounds can deviate from the stoichiometry shown here.

Body-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}b\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{1}{2}b\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}b\,\hat{\mathbf{y}} - \tfrac{1}{2}c\,\hat{\mathbf{z}}$$

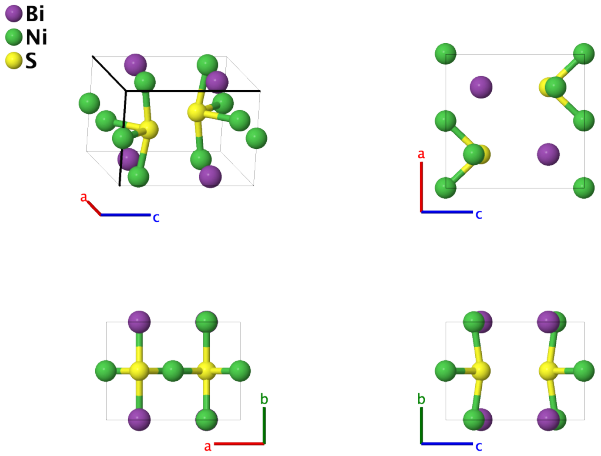
Parkerite ($Ni_3Bi_2S_2$) Structure: AB2C_oP8_51_e_be_f

http://aflow.org/prototype-encyclopedia/AB2C_oP8_51_e_be_f



Prototype	:	$Bi_2Ni_3S_2$
AFLOW prototype label	:	AB2C_oP8_51_e_be_f
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP8
Space group number	:	51
Space group symbol	:	*Pmma*
AFLOW prototype command	:	`aflow --proto=AB2C_oP8_51_e_be_f --params=`$a, b/a, c/a, z_2, z_3, z_4$

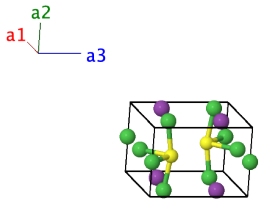
Other compounds with this structure

- $Ni_3(Bi,Pb)_2S_2$

- (Fleet, 1973) states that parkerite is a derivative of the shandite ($Ni_3Pb_2S_2$) structure, and changes to shandite if more than 4% of the bismuth is replaced by lead.
- The Ni-II ($2e$) site is occupied 50% of the time, given the observed stoichiometry.
- Earlier sources give parkerite a monoclinic structure. This may be due to an ordering of the nickel atoms at lower temperature. We follow (Downs, 2003) and use the orthorhombic structure.
- (Fleet, 1973) describes the structure in the *Pmam* setting of space group #51. We used FINDSYM to transform it to the standard *Pmma* setting.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type

- (Lundberg, 1965) suggests that the lithium atoms are either on the (2*d*) site or are statistically distributed on a (4*j*) site with approximate coordinates (0.08,1/2,0.10). For simplicity we place the atoms on the (2*d*) site.
- The x-ray scattering of a F^- ion is almost identical to that of O^{2-}, and Lundberg was not able to distinguish between them. She arbitrarily designated the (2*f*) site she also called O_4 as the location of the fluorine ion and we follow this, but in reality we have no idea if the F^- ions are located on this site, are ordered on another site, or are statistically distributed on the oxygen sites.

Other compounds with this structure

- $Mg(H_2O)_6K(Cl,Br)_3$

- (Andreß, 1939) determined the crystal structure of brom-carnallite, $Mg(H_2O)_6K(Cl,Br)_3$, finding that it was in space group $P4/n$ #85. (Herrmann, 1939) gave this structure the *Strukturbericht* designation $E2_6$. Later, (Schlemper, 1985), determined that the true space group was *Pnna* #52, and were able to determine the positions of the hydrogen atoms in the water molecules. We present this structure here. For the original structure, see the $E2_6$ page.

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

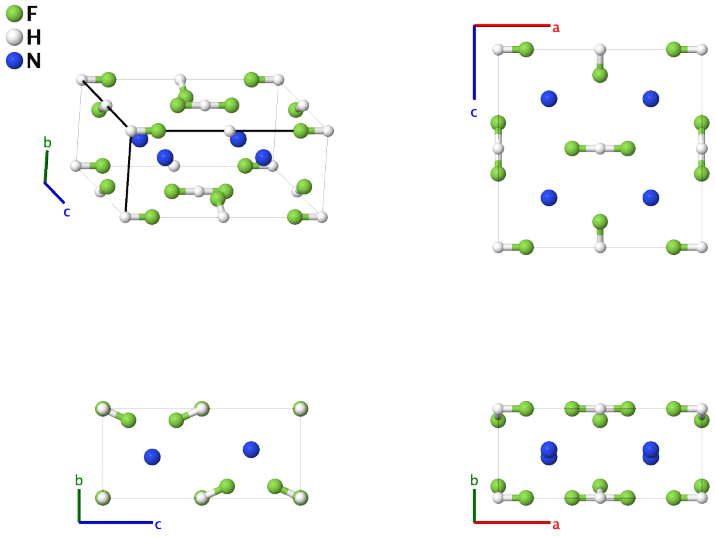
NH_4HF_2 ($F5_8$) Structure: A2BC_oP16_53_eh_ab_g

http://aflow.org/prototype-encyclopedia/A2BC_oP16_53_eh_ab_g



Prototype	:	F_2H_5N
AFLOW prototype label	:	A2BC_oP16_53_eh_ab_g
***Strukturbericht* designation**	:	$F5_8$
Pearson symbol	:	oP16
Space group number	:	53
Space group symbol	:	*Pmna*
AFLOW prototype command	:	`aflow --proto=A2BC_oP16_53_eh_ab_g --params=`$a, b/a, c/a, x_3, y_4, y_5, z_5$

- This structure was first investigated by (Pauling, 1933) and assigned *Strukturbericht* designation $F5_8$ by (Gottfried, 1937). It was reinvestigated by (Rogers, 1940). Neither paper notes the positions of the hydrogen atoms, but under the assumption that the structure is similar to KHF_2 ($F5_2$), (Downs, 2003) puts some of them between pairs of fluorine atoms. The remaining hydrogen atoms are part of the NH_4 radical.
- The crystal structure was given in the *Pman* setting of space group #53. We used FINDSYM to change it to the standard *Pmna* structure.

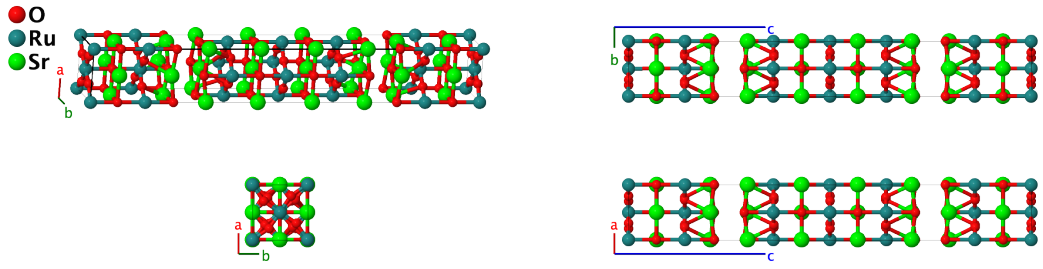
Orthorhombic $Sr_4Ru_3O_{10}$ Structure: A10B3C4_oP68_55_2e2fgh2i_adef_2e2f

http://aflow.org/prototype-encyclopedia/A10B3C4_oP68_55_2e2fgh2i_adef_2e2f



Prototype	:	$O_{10}Ru_3Sr_4$
AFLOW prototype label	:	A10B3C4_oP68_55_2e2fgh2i_adef_2e2f
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP68
Space group number	:	55
Space group symbol	:	*Pbam*
AFLOW prototype command	:	`aflow --proto=A10B3C4_oP68_55_2e2fgh2i_adef_2e2f --params=`$a, b/a, c/a, z_3, z_4, z_5, z_6, z_7, z_8, z_9, z_{10}, z_{11}, z_{12}, x_{13}, y_{13}, x_{14}, y_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}$

- This structure consists of triple-layer ruthenate structures separated by 2.37 Å from each other. In the *Pbam* #55 space group shown here there are two inequivalent stacks in the orthorhombic cell.
- This cell is very problematic. (Crawford, 2002) note that the x-ray scattering intensities are pseudo body-centered, but found that refining this structure in a body-centered cell with space group *Bbcm* (*Cmca* #64 in our standard orientation) led to non-positive definite thermal parameters. However, if we allow a lattice and atom position uncertainty of only 0.01 Å in the atomic coordinates, AFLOW-SYM and FINDSYM place the structure in base-centered space group *Cmca* #64, oC68. In that case there is only one triple-layer stack in the primitive cell, and the two stacks in the conventional orthorhombic cell are equivalent.

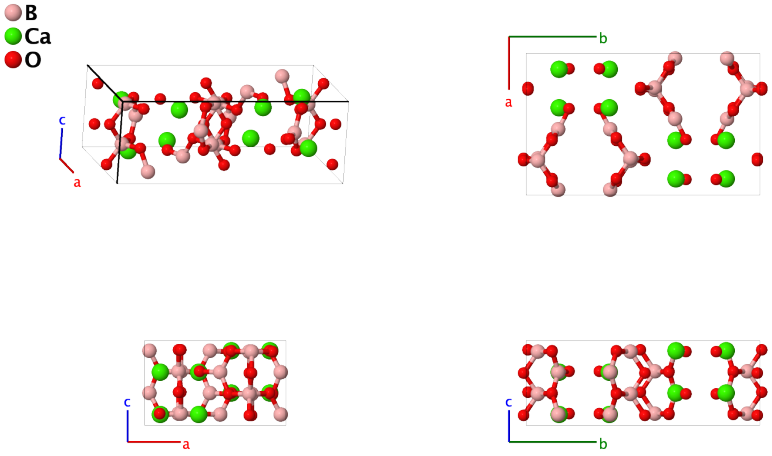
Calciborite (CaB_2O_4 II) Structure: A2BC4_oP56_56_2e_e_4e

http://aflow.org/prototype-encyclopedia/A2BC4_oP56_56_2e_e_4e



Prototype	:	B_2CaO_4
AFLOW prototype label	:	A2BC4_oP56_56_2e_e_4e
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP56
Space group number	:	56
Space group symbol	:	*Pccn*
AFLOW prototype command	:	`aflow --proto=A2BC4_oP56_56_2e_e_4e --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7$

- CaB_2O_4 exists in at least four phases (Marezio, 1969):
- I - The ground state, stable below 1.2 GPa, *Strukturbericht* $E3_2$.
- II – Orthorhombic high pressure structure, stable between 1.2 and 1.5 GPa, presumably calciborite (this structure).
- III – Orthorhombic high pressure structure, stable between 1.5 and 2.5 GPa.
- IV – Cubic high pressure structure, stable between 2.5 and 4.0 GPa.
- This structure has the same orthorhombic lattice constants as the CaB_2O_4 II structure identified in (Marezio, 1969ab), however they state that the structure is stable between 1.2 and 1.5 GPa, while this mineral was obtained "From drillcore into a contact metasomatized limestone near a quartz diorite intrusion associated with a copper deposit in skarn." (Downs, 2003).

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

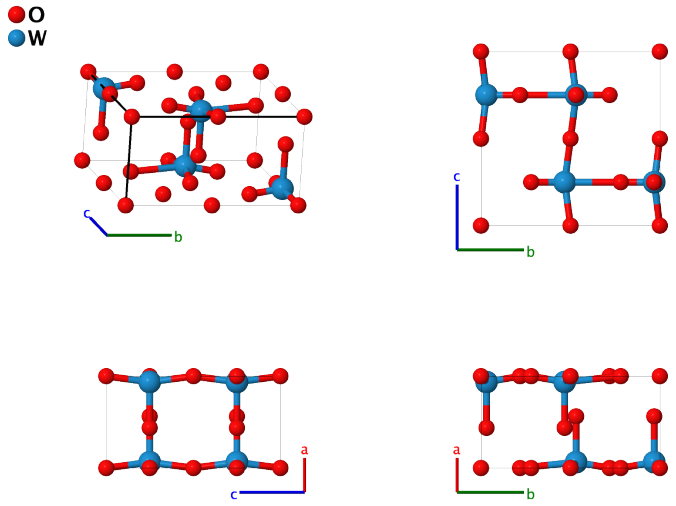
$D0_{10}$ (WO_3) (*obsolete*) Structure: A3B_oP16_57_a2d_d

http://aflow.org/prototype-encyclopedia/A3B_oP16_57_a2d_d



Prototype	:	O_3W
AFLOW prototype label	:	A3B_oP16_57_a2d_d
***Strukturbericht* designation**	:	$D0_{10}$
Pearson symbol	:	oP16
Space group number	:	57
Space group symbol	:	*Pbcm*
AFLOW prototype command	:	`aflow --proto=A3B_oP16_57_a2d_d --params=`$a, b/a, c/a, x_2, y_2, x_3, y_3, x_4, y_4$

- All stable phases of WO_3 are distortions of the cubic α-ReO_3 ($D0_9$) phase. Based on (Woodward, 1997 and Vogt, 1999), the known stable phases and their approximate temperature ranges are:
  - α-WO_3 (1010-1170 K) (Vogt, 1999)
  - β-WO_3 (600-1170 K) (Vogt, 1999)
  - γ-WO_3 (290-600 K) (Vogt, 1999)
  - δ-WO_3 (230-290 K) (Diehl, 1978)
  - ϵ-WO_3 (below 23 K) (Woodward, 1997)

  Woodward's caption says "The transition temperatures display large hysteresis effects and universal agreement is not found in the literature."
- In addition, several other structures have been proposed and/or found:
  - The original $D0_{10}$ structure (Bräkken, 1931), (Hermann, 1937), this structure, superseded by δ-WO_3
  - Original β-WO_3 (Salje, 1977)
  - Hexagonal WO_3 (Gerand, 1979) (metastable)
