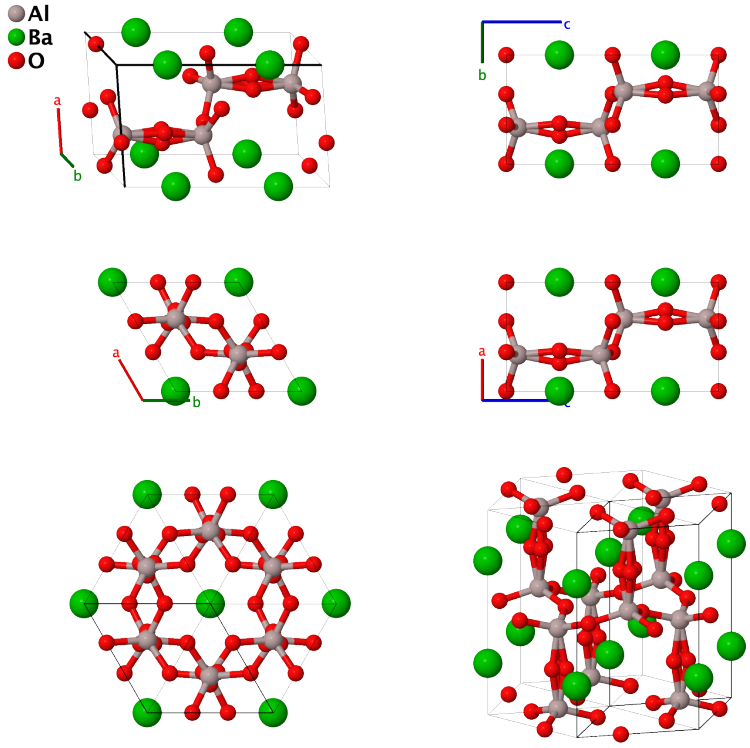
$BaAl_2O_4$ ($H2_8$) Structure: A2BC6_hP18_182_f_b_gh

http://aflow.org/prototype-encyclopedia/A2BC6_hP18_182_f_b_gh



Prototype	:	Al_2BaO_4
AFLOW prototype label	:	A2BC6_hP18_182_f_b_gh
***Strukturbericht* designation**	:	$H2_8$
Pearson symbol	:	hP18
Space group number	:	182
Space group symbol	:	$P6_322$
AFLOW prototype command	:	`aflow --proto=A2BC6_hP18_182_f_b_gh --params=`$a, c/a, z_2, x_3, x_4$

- The structure of $BaAl_2O_4$ was originally determined by (Wallmark, 1937) and designated $H2_8$ by (Gottfried, 1940). This had two oxygen atoms at the ($2c$) Wyckoff position, $\pm(1/3, 2/3, z)$. (Perrotta, 1968) redetermined the structure and found that the best fit to external data required the ($2c$) oxygen atoms to be distributed among the ($6h$) sites. Thus each of the ($6h$) sites in this structure is 1/3 occupied.

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

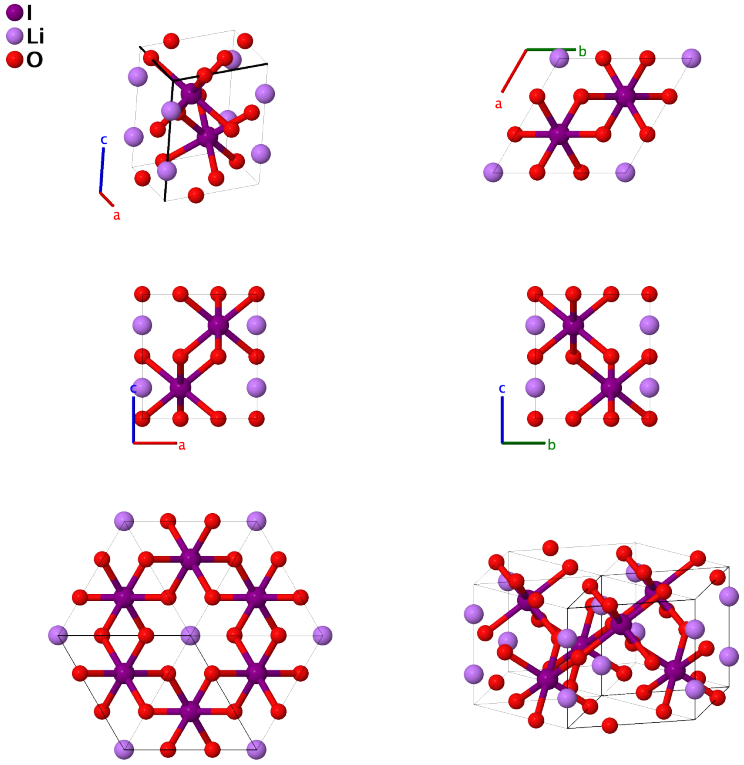
$E2_3$ ($LiIO_3$) (*obsolete*) Structure: ABC3_hP10_182_c_b_g

http://aflow.org/prototype-encyclopedia/ABC3_hP10_182_c_b_g



Prototype	:	$ILiO_3$
AFLOW prototype label	:	ABC3_hP10_182_c_b_g
***Strukturbericht* designation**	:	$E2_3$
Pearson symbol	:	hP10
Space group number	:	182
Space group symbol	:	$P6_322$
AFLOW prototype command	:	`aflow --proto=ABC3_hP10_182_c_b_g --params=`$a, c/a, x_3$

- $LiIO_3$ is known to exist in three forms:
  - α-$LiIO_3$, stable below 273 K: (Zachariasen, 1931) originally determined that this was the structure of α-$LiIO_3$, and (Hermann, 1937) designated it as *Strukturbericht* $E2_3$. (Rosenzweig, 1966) subsequently determined that this structure was incorrect because of the small sample size, and determined that the true structure was in space group $P6_3$ #173.
  - β-$LiIO_3$, stable from 573 K up to the melting point at 708 K.
  - γ-$LiIO_3$, stable between the α- and β-phases, with an orthorhombic structure.

Hexagonal primitive vectors:

***Strukturbericht* designation**	:	$E9_2$
Pearson symbol	:	hP26
Space group number	:	186
Space group symbol	:	$P6_3mc$
AFLOW prototype command	:	`aflow --proto=A4BC7D_hP26_186_ac_b_a2c_b --params=`$a, c/a, z_1, z_2, z_3, z_4, x_5, z_5, x_6, z_6, x_7, z_7$

Other compounds with this structure

- $CaBa(Fe_2Mn_2)O_7$, $CaBaCo_3AlO_7$, $CaBaCo_3FeO_7$, $CaBaCo_3ZnO_7$, $CaBaCo_4O_7$, $CaBaFe_4O_7$, $Er_2Si_4N_6C$, $Ho_2Si_4N_6C$, $Tb_2Si_4N_6C$, $Y_2Si_4N_6C$, $YBaCo_3AlO_7$, $YBaCo_3FeO_7$, $YBaCo_4O_7$, $YBaMn_3AlO_7$, $Yb_2Si_4N_6C$, and $YbBaSi_4N_7$

- The actual composition of the studied sample is ($Na_{0.89}Ca_{0.04}Be_4SbO_7$), with the sodium (Na-I) site containing 89% sodium, 4% calcium, and 7% vacancies.
- Space group $P6_3mc$ #186 does not fix the origin of the z-coordinate. Here the position of the antimony atom (Sb-I) is set so that $z_4 = 0$.

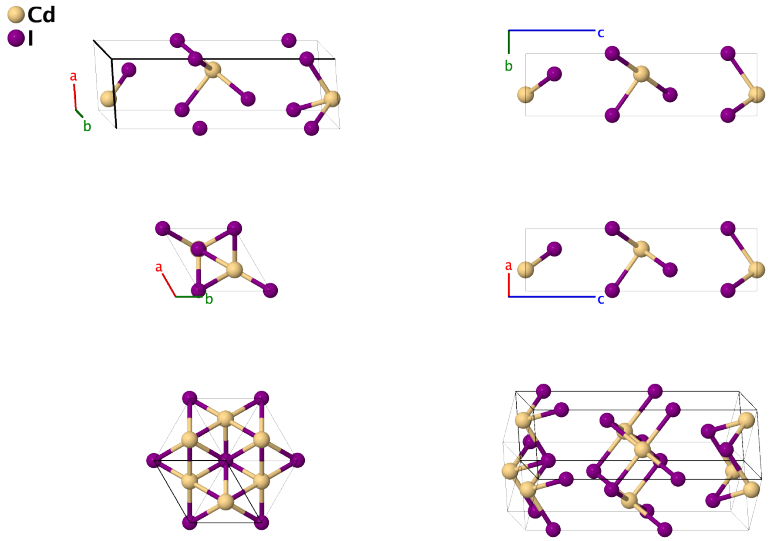
*C*27 (CdI_2) (*questionable*) Structure: AB2_hP6_186_b_ab

http://aflow.org/prototype-encyclopedia/AB2_hP6_186_b_ab



Prototype	:	CdI_2
AFLOW prototype label	:	AB2_hP6_186_b_ab
***Strukturbericht* designation**	:	*C*27
Pearson symbol	:	hP6
Space group number	:	186
Space group symbol	:	$P6_3mc$
AFLOW prototype command	:	`aflow --proto=AB2_hP6_186_b_ab --params=`$a, c/a, z_1, z_2, z_3$

- This is a modification of the *C*6 (ω phase) CdI_2 structure proposed by (Hassel, 1933) to explain extra lines found in the x-ray spectra. This structure was never accepted by most researchers and does not appear in modern lists of *Strukturbericht* symbols, although (Parthé, 1993) lists it as a stacking varient of CdI_2. We include it here as part of the historical record.
- Hassel originally placed a Cd atom at the origin, however both (Gottfried, 1937) and FINDSYM shift the origin as shown.

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

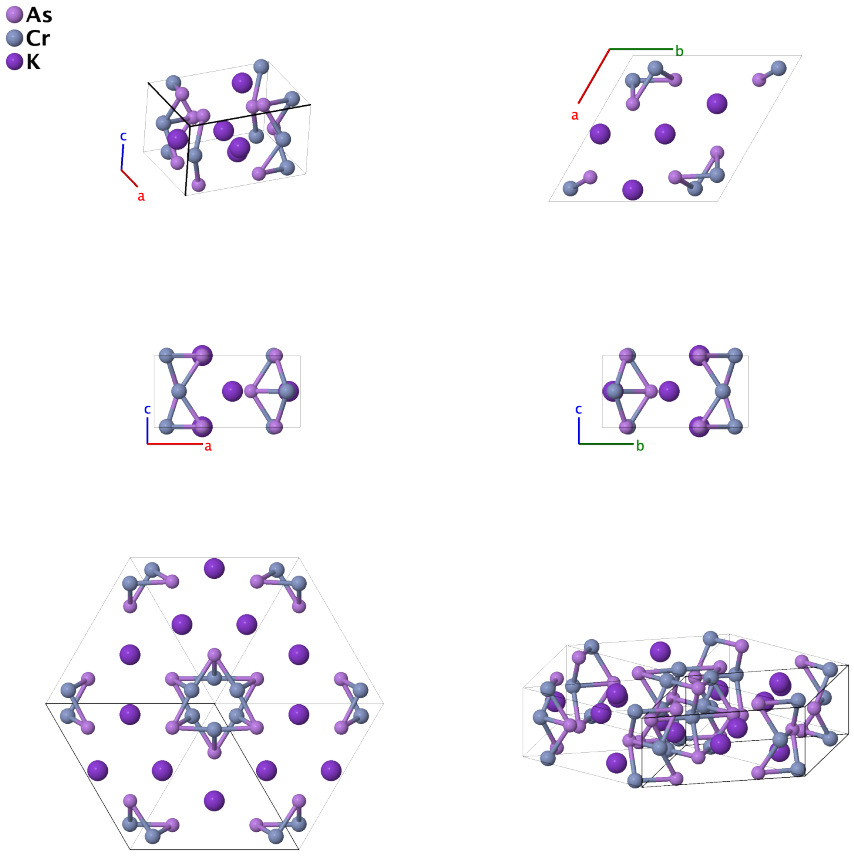
Cr-233 Quasi-One-Dimensional Superconductor ($K_2Cr_3As_3$) Structure: A3B3C2_hP16_187_jk_jk_ck

http://aflow.org/prototype-encyclopedia/A3B3C2_hP16_187_jk_jk_ck



Prototype	:	$As_3Cr_3K_2$
AFLOW prototype label	:	A3B3C2_hP16_187_jk_jk_ck
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP16
Space group number	:	187
Space group symbol	:	$P\bar{6}m2$
AFLOW prototype command	:	`aflow --proto=A3B3C2_hP16_187_jk_jk_ck --params=`$a, c/a, x_2, x_3, x_4, x_5, x_6$

Other compounds with this structure

- $Cs_2Cr_3As_3$, $Rb_2Cr_3As_3$, and $K_2Mo_3As_3$

- Cr-233 designates a class of structures of the form $A_2B_2As_3$, where the 'A' atoms form one-dimensional chains. Several of these compounds have been found to superconduct at temperatures on the order of 5-10 K.

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

- This structure is composed of $Cs_{11}O_3$ clusters, similar to the building blocks of the $Cs_{11}O_3$ structure, interlaced with cesium atoms which have approximately the same spacing as in bcc-Cs.

- Lattice constant data was given at -150 °C, while the atomic positions were given at -175 °C.

Hexagonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

Other compounds with this structure

- AgAsCa, AgSiYb, AlCoPu, AlCuTm, AlNiTb, DyNiIn, DyNiSn, ErNiAl, FeGaU, FeNiP, GdNiIn, GdNiSn, HoNiIn, RhSnZr, RuSiZr, ScIrP, TbNiIn, and BSi_2Ni_6

- This is the ternary form of the Fe_2P structure. In the former case the origin was placed so that the potassium atoms were on the (1*b*) and (2*c*) Wyckoff positions, while here we follow (Shved, 2019) and place the nickel atoms on the (1*a*) and (2*d*) sites. This is merely a shift in the origin by $1/2\, c\, \hat{z}$. If the structures have a common origin then they are nearly identical.
- (Shved, 2019) found evidence of 6-10% mixing between the Ni-II (2*d*) and Al (3*g*) sites.

Hexagonal primitive vectors:

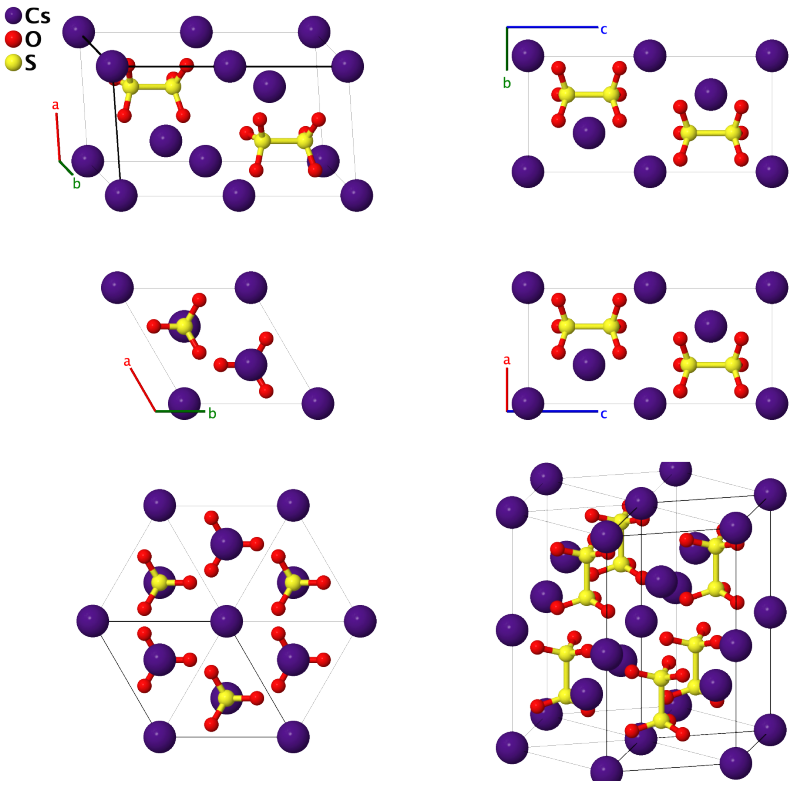
$CsSO_3$ ($K1_2$) Structure: AB3C_hP20_190_ac_i_f

http://aflow.org/prototype-encyclopedia/AB3C_hP20_190_ac_i_f



Prototype	:	CsO_3S
AFLOW prototype label	:	AB3C_hP20_190_ac_i_f
***Strukturbericht* designation**	:	$K1_2$
Pearson symbol	:	hP20
Space group number	:	190
Space group symbol	:	$P\bar{6}2c$
AFLOW prototype command	:	`aflow --proto=AB3C_hP20_190_ac_i_f --params=`$a, c/a, z_3, x_4, y_4, z_4$

- (Hägg, 1932) states that the space group might be $P6_322$ #182 or $P\bar{6}2c$ #190. We follow (Downs, 2003) and use the latter. (Hägg, 1932) and (Downs, 2003) set the sulfur coordinate $z_3 = 0.73$. As noted by (Hermann, 1937), this gives a very short S-S bond distance, on the order of 0.5Å. We use the value suggested by (Hermann, 1937), $z_3 = 0.63$, "which gives the S_2O_6 group exactly the same shape it has in $K_2S_2O_6$ [*Strukturbericht* $K1_1$]."

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}$$

- The structure of $TiBe_{12}$ is not settled. (Raeuchle, 1952) described the structure as a somewhat disordered supercell containing 48 atoms with lattice constants $a = 29.44$ Å and $c = 7.33$ Å, but they stated that a 'pseudo-cell' existed with dimensions $a = 4.23$ Å and $c = 7.33$ Å. This pseudo-cell is described here, and was assigned the $D2_a$ *Strukturbericht* type by Smithells (Brandes, 1992). Raeuchle and Rundle suggested that the larger primitive cell was constructed from the multiple pseudo-cells, with the titanium atom alternating between the ($1a$) and ($1b$) $(0, 0, 1/2)$ Wyckoff positions.
- Other experimenters have suggested that the actual structure of $TiBe_{12}$ is tetragonal. (Jackson, 2016) presents first-principles calculations which suggest that the actual structure is of the tetragonal $ThMn_{12}$ ($D2_b$) type.

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

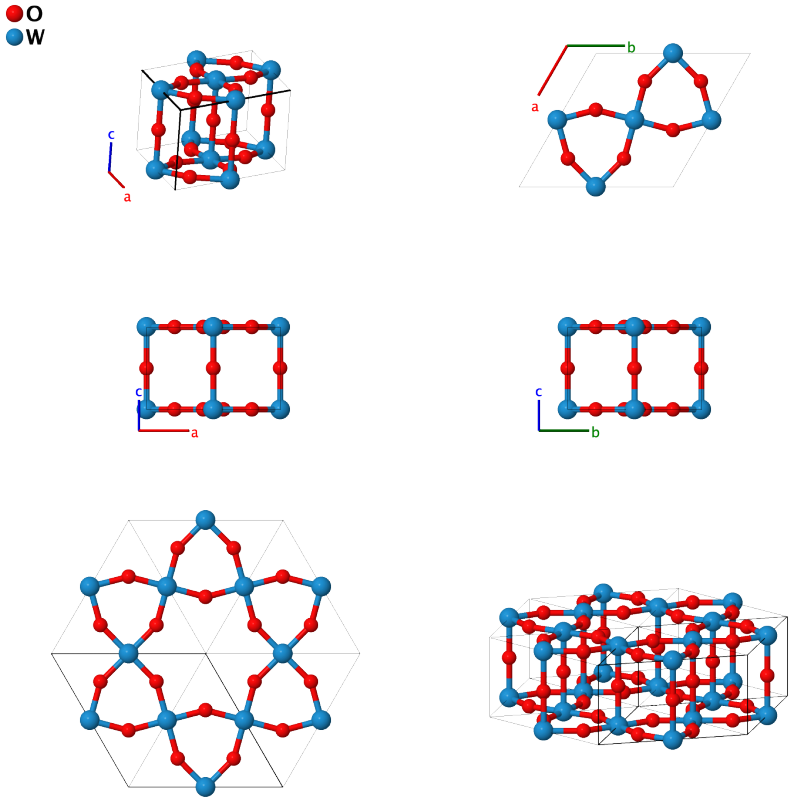
Hexagonal WO_3 Structure: A3B_hP12_191_gl_f

http://aflow.org/prototype-encyclopedia/A3B_hP12_191_gl_f



Prototype	:	O_3W
AFLOW prototype label	:	A3B_hP12_191_gl_f
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP12
Space group number	:	191
Space group symbol	:	$P6/mmm$
AFLOW prototype command	:	`aflow --proto=A3B_hP12_191_gl_f --params=`$a, c/a, x_3$

- All stable phases of WO_3 are distortions of the cubic α-ReO_3 ($D0_9$) phase. Based on (Woodward, 1997 and Vogt, 1999), the known stable phases and their approximate temperature ranges are:
  - α-WO_3 (1010-1170 K) (Vogt, 1999)
  - β-WO_3 (600-1170 K) (Vogt, 1999)
  - γ-WO_3 (290-600 K) (Vogt, 1999)
  - δ-WO_3 (230-290 K) (Diehl, 1978)
  - ϵ-WO_3 (below 23 K) (Woodward, 1997)

  Woodward's caption says "The transition temperatures display large hysteresis effects and universal agreement is not found in the literature."

- In addition, several other structures have been proposed and/or found:
  - The original $D0_{10}$ structure (Bräkken, 1931), (Hermann, 1937) superseded by δ-WO_3
  - Original β-WO_3 (Salje, 1977)
  - Hexagonal WO_3 (Gerand, 1979) (metastable), this structure

- This stucture was one of several considered by (Hermann, 1937) as a candidate structure for tysonite, and was chosen because it gave the best positioning of the fluorine atoms. Later, (Zalkin, 1985) showed that the structure was trigonal rather than hexagonal, and isostructural with Cu_3P ($D0_{21}$). We keep the original structure as part of the historical record.

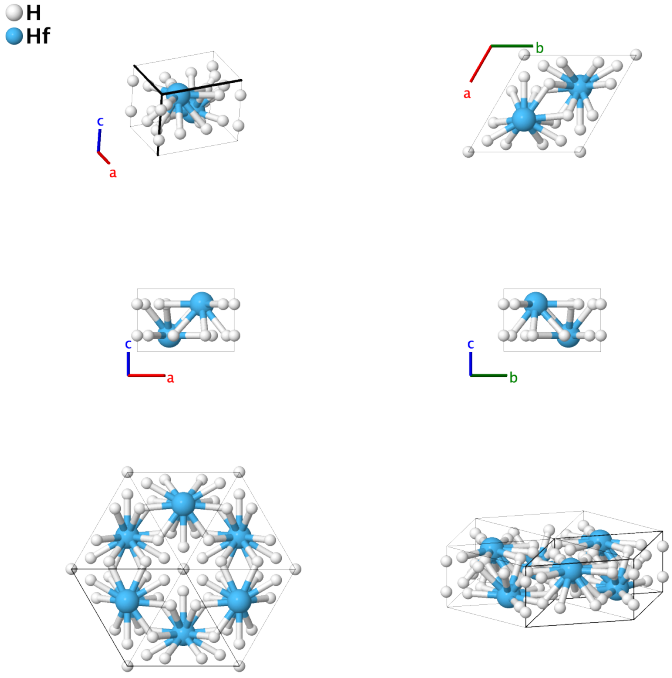
Proposed 300 GPa HfH_{10} Structure: A10B_hP22_194_bhj_c

http://aflow.org/prototype-encyclopedia/A10B_hP22_194_bhj_c



Prototype	:	$H_{10}Hf$
AFLOW prototype label	:	A10B_hP22_194_bhj_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP22
Space group number	:	194
Space group symbol	:	$P6_3/mmc$
AFLOW prototype command	:	`aflow --proto=A10B_hP22_194_bhj_c --params=`$a, c/a, x_3, x_4, y_4$

Other compounds with this structure

- LuH_{10}, ScH_{10}, and ZrH_{10}

- This structure has only been determined computationally. At 300 GPa it is predicted to have a superconducting transitions temperature T_c above 200 K.

Hexagonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

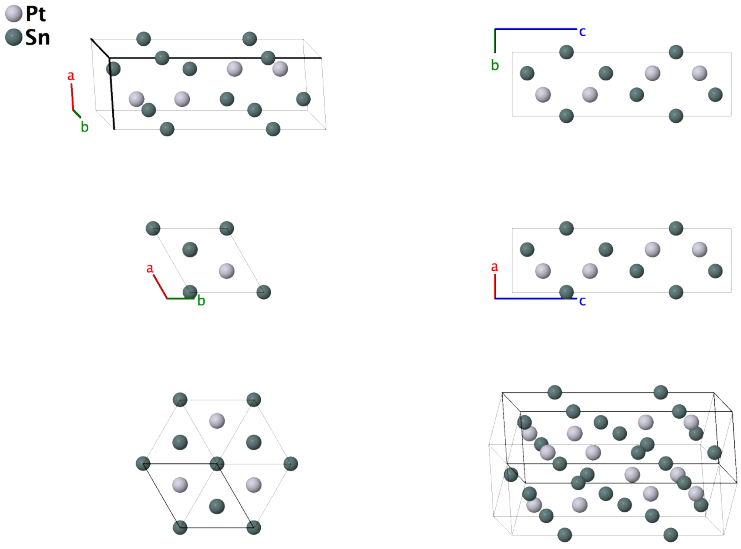
Pt_2Sn_3 ($D5_b$) Structure: A2B3_hP10_194_f_bf

http://aflow.org/prototype-encyclopedia/A2B3_hP10_194_f_bf



Prototype	:	Pt_2Sn_3
AFLOW prototype label	:	A2B3_hP10_194_f_bf
***Strukturbericht* designation**	:	$D5_b$
Pearson symbol	:	hP10
Space group number	:	194
Space group symbol	:	$P6_3/mmc$
AFLOW prototype command	:	`aflow --proto=A2B3_hP10_194_f_bf --params=`$a, c/a, z_2, z_3$

Other compounds with this structure

- Pt_2Si_3, $InAu_2Ga_2$, and $Au_4In_3Sn_3$

- We were unable to obtain a copy of (Schubert, 1949), and so we use the structural parameters given by (Pearson, 1958), using (Wood, 1947) to convert the kX units used by Pearson into Ångström units.

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

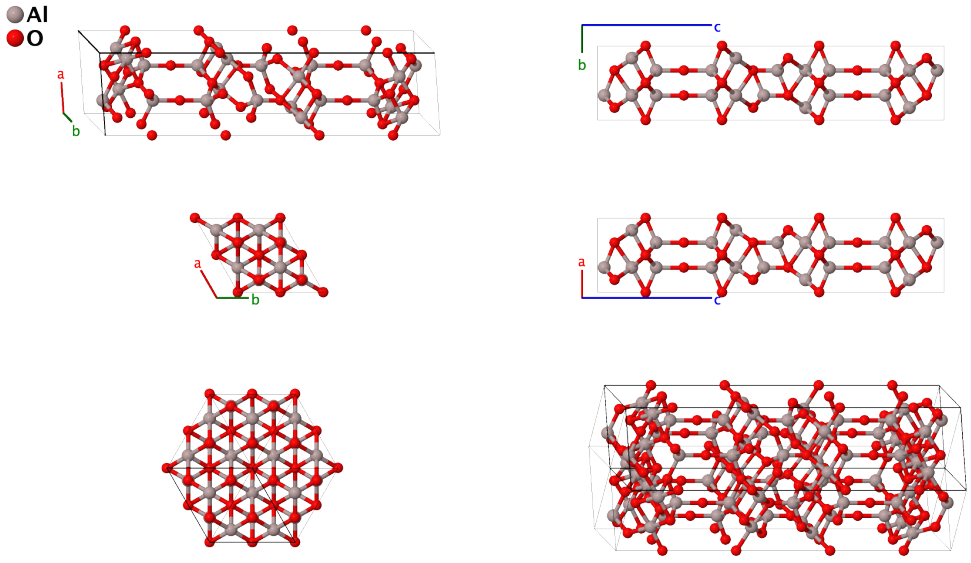
β-Alumina (Al_2O_3, $D5_6$) Structure: A2B3_hP60_194_3fk_cdef2k

http://aflow.org/prototype-encyclopedia/A2B3_hP60_194_3fk_cdef2k



Prototype	:	Al_2O_3
AFLOW prototype label	:	A2B3_hP60_194_3fk_cdef2k
***Strukturbericht* designation**	:	$D5_6$
Pearson symbol	:	hP60
Space group number	:	194
Space group symbol	:	$P6_3/mmc$
AFLOW prototype command	:	`aflow --proto=A2B3_hP60_194_3fk_cdef2k --params=`$a, c/a, z_3, z_4, z_5, z_6, z_7, x_8, z_8, x_9, z_9, x_{10}, z_{10}$

- (Hermann, 1937) assigned this the *Strukturbericht* designation $D5_6$, calling it β-corundum, and subtitles the section "with small Na_2O impurities." As noted by (Gottfried, 1937) and (Le Cars, 1975), the Na impurities replace Al atoms on the ($4f$) Wyckoff positions, along with some unspecified O sites. Charge neutrality requires that some of the displaced atoms remain in the lattice, and they are moved to ($2a$) Wyckoff positions at (0, 0, 0) and (0, 0, 1/2). Here we only list the "ideal" structure.

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

- This hexagonal structure has been superseded by the monoclinic structure of (Ilyushin, 1981). We present it here for historical interest.
- We were unable to procure the original reference, so we use the data provided by (Gottfried, 1937).
- Four of the (6*g*) sites are randomly occupied by water molecules.
- (Gottfried, 1937) originally gave the *Strukturbericht* designation $S\,3_4$ to chabazite, but (Gottfried, 1940) gave it to this structure of catapleiite. We resolve this dilemma by using $S\,3_4$(I) for chabazite and $S\,3_4$(II) for catapleiite.

Hexagonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

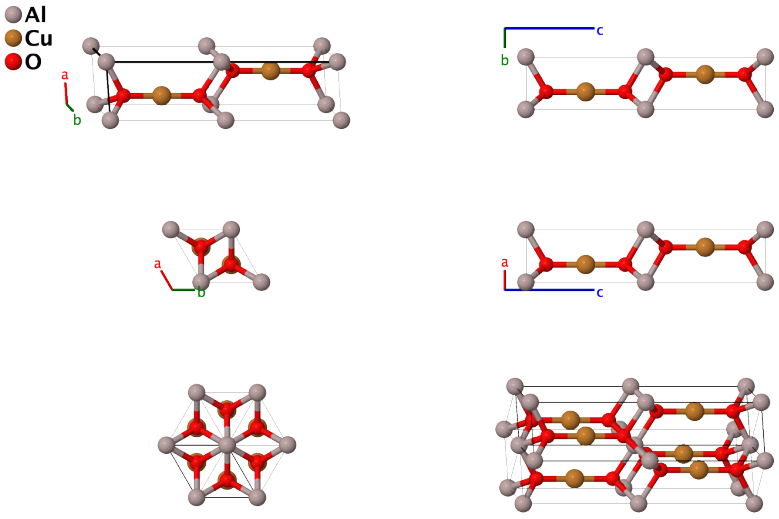
Hexagonal Delafossite ($CuAlO_2$) Structure: ABC2_hP8_194_a_c_f

http://aflow.org/prototype-encyclopedia/ABC2_hP8_194_a_c_f



Prototype	:	$AlCuO_2$
AFLOW prototype label	:	ABC2_hP8_194_a_c_f
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP8
Space group number	:	194
Space group symbol	:	$P6_3/mmc$
AFLOW prototype command	:	`aflow --proto=ABC2_hP8_194_a_c_f --params=`$a, c/a, z_3$

Other compounds with this structure

- $CuGaO_2$, $CuScO_2$, and $CuYO_2$

- Delafossite appears in two forms which differ in the stacking of the layers: rhombohedral, prototype $CuFeO_2$, and hexagonal, shown here. Most of the structures found in the hexagonal phase can also be found in the rhombohedral structure (Marquardt, 2006).

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

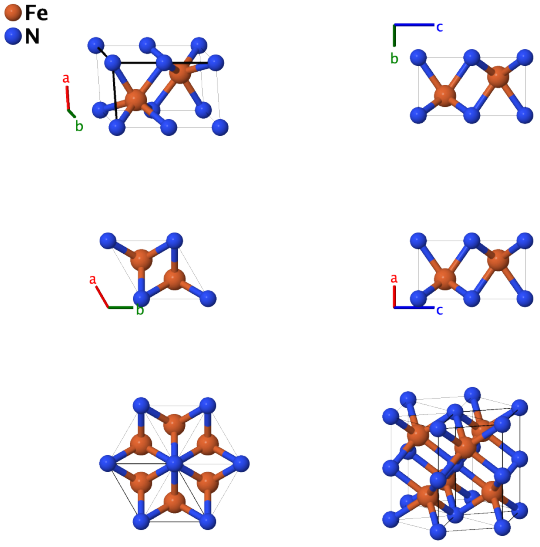
Fe_2N (approximate, $L'3_0$) Structure: AB_hP4_194_c_a

http://aflow.org/prototype-encyclopedia/AB_hP4_194_c_a.Fe2N



Prototype	:	Fe_2N
AFLOW prototype label	:	AB_hP4_194_c_a
***Strukturbericht* designation**	:	$L'3_0$
Pearson symbol	:	hP4
Space group number	:	194
Space group symbol	:	$P6_3/mmc$
AFLOW prototype command	:	`aflow --proto=AB_hP4_194_c_a --params=`$a, c/a$

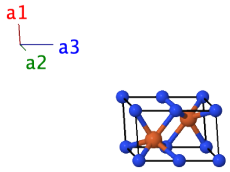
Other compounds with this structure

- β-CTa_2, CV_2, CW_2, Mn_2N, Nb_2N, and $Ta_{\approx 2}N$

- The $L'3_0$ designation is only found in (Smithells, 1955) and (Pearson, 1958), as well as their following volumes. Smithells gives two possible positions of the nitrogen atoms. We use the one that matches Pearson, which (Parthé, 1993) notes is equivalent to the NiAs $B8_1$ structure, but here the ($2a$) nitrogen site is only half-filled to maintain stoichiometry.
- Neither of the defining references gives a source for the structure. It is likely an approximation to ϵ-Fe_2N, which has the β-V_2N $L'3_2$ structure. We take the lattice constants for this structure from the Fe-Fe distances in ϵ-Fe_2N provided by (Hendricks, 1930).
- The similar compounds list is taken from (Pearson, 1967). As it is quite similar to the list for β-V_2N, it is likely that this structure is only an approximation to the correct structure for these compounds as well.
- This structure has the same AFLOW designation, AB_hP4_194_c_a.Fe2N, as $B8_1$. The two structures differ by their lattice constants and the half-occupancy of the ($2a$) site in $L'3_0$.

Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	$(2a)$	N
$\mathbf{B}_2$	=	$\frac{1}{2}\,\mathbf{a}_3$	=	$\frac{1}{2}c\,\hat{\mathbf{z}}$	$(2a)$	N
$\mathbf{B}_3$	=	$\frac{1}{3}\,\mathbf{a}_1 + \frac{2}{3}\,\mathbf{a}_2 + \frac{1}{4}\,\mathbf{a}_3$	=	$\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{4}c\,\hat{\mathbf{z}}$	$(2c)$	Fe
$\mathbf{B}_4$	=	$\frac{2}{3}\,\mathbf{a}_1 + \frac{1}{3}\,\mathbf{a}_2 + \frac{3}{4}\,\mathbf{a}_3$	=	$\frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{3}{4}c\,\hat{\mathbf{z}}$	$(2c)$	Fe

AFLOW prototype label	:	AB2C4D_cP32_198_a_2a_ab_a
***Strukturbericht* designation**	:	$S6_6$
Pearson symbol	:	cP32
Space group number	:	198
Space group symbol	:	$P2_13$
AFLOW prototype command	:	`aflow --proto=AB2C4D_cP32_198_a_2a_ab_a --params=`$a, x_1, x_2, x_3, x_4, x_5, x_6, y_6, z_6$

Other compounds with this structure

- Li_2SrSi_4

- Substitution of small fractions of rare earth elements onto the Ca site can produce photoluminescence.
- This is the crystal structure found by (Barth, 1932). The coordinates on pp. 159 of (Hermann, 1937) are incorrect, as they do not correctly transform from Barth and Posnjak's coordinates in degrees to fractional coordinates. See (Hermann, 1937) pp. 557-8 for the correct coordinates.
- (Dollase, 1991) found that the SiO_4 tetrahedra were orientationally disordered, and that the resulting $Na_2Ca(SiO_4)$ structure took on the Heusler ($L1_2$) structure.

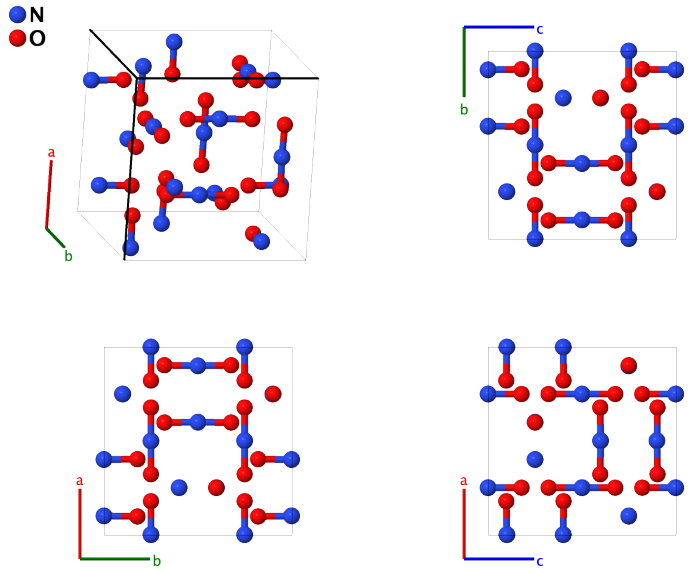
$C26_a$ (NO_2) (*obsolete*) Structure: AB2_cI36_199_b_c

http://aflow.org/prototype-encyclopedia/AB2_cI36_199_b_c



Prototype	:	NO_2
AFLOW prototype label	:	AB2_cI36_199_b_c
***Strukturbericht* designation**	:	$C26_a$
Pearson symbol	:	cI36
Space group number	:	199
Space group symbol	:	$I2_13$
AFLOW prototype command	:	`aflow --proto=AB2_cI36_199_b_c --params=`a, x_1, x_2, y_2, z_2

- (Hermann, 1937) listed two possible structures for the low temperature solid cubic phase of NO_2, which were given *Strukturbericht* designations $C26_a$ and $C26_b$, the only structures with Roman subscripts in the original series.
- $C26_a$ (AB2_cI36_199_b_c) was set in space group $I2_13$ #199. Hermann noted that this structure has a very short distance (1.88 Å) between oxygen atoms on different NO_2 molecules, and that this structure does not form the $(NO_2)_2$ aggregate molecule found in the $C26_b$ structure, making "making this proposed structure very unlikely."
- Recognizing this, (Hendricks, 1931) suggested that NO_2 was actually in space group $I23$ #197. (Hermann, 1997) gave this structure the $C26_b$ designation, but noted that based on Hendricks's atomic positions the space group was actually $Im\bar{3}$ #204.
- The modern accepted structure for NO_2 (AB2_cI36_204_d_g) is set in space group $Im\bar{3}$ #204, confirming Hendricks. We follow (Villars, 2005) and give this the $C26$ designation.

Body-centered Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} - \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\end{aligned}$$

Other compounds with this structure

- $CaCu_3Ge_4O_{12}$ and $CaCu_3Mn_4O_{12}$

- This is a double perovskite structure, and is only stable above 3 Gbar and above room temperature, but it is metastable under ambient conditions (Gilioli, 2005ab). The actual composition of the measured sample is $Na_{0.95}Mn_{7.05}O_{12}$, with the excess manganese displacing some of the sodium atoms on the ($2a$) site.

Body-centered Cubic primitive vectors:

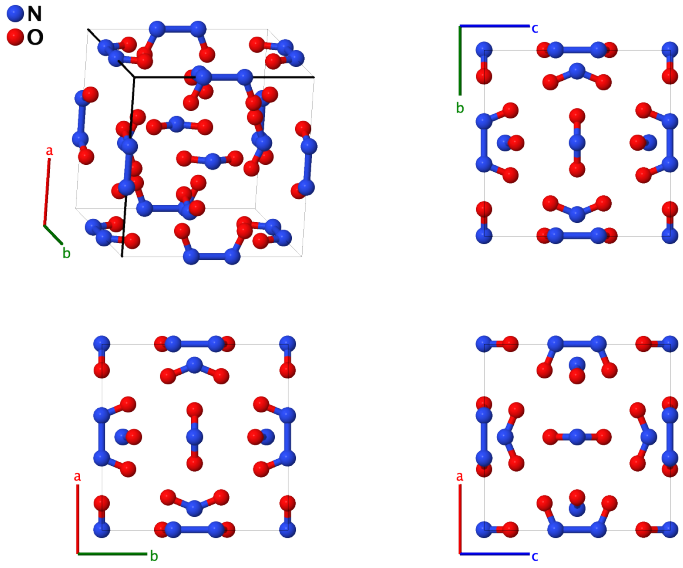
NO_2 (Modern, *C*26) Structure: AB2_cI36_204_d_g

http://aflow.org/prototype-encyclopedia/AB2_cI36_204_d_g



Prototype	:	NO_2
AFLOW prototype label	:	AB2_cI36_204_d_g
***Strukturbericht* designation**	:	*C*26
Pearson symbol	:	cI36
Space group number	:	204
Space group symbol	:	$Im\bar{3}$
AFLOW prototype command	:	`aflow --proto=AB2_cI36_204_d_g --params=`a, x_1, y_2, z_2

- (Hermann, 1937) listed two possible structures for the low temperature solid cubic phase of NO_2, which were given *Strukturbericht* designations $C26_a$ and $C26_b$, the only structures with Roman subscripts in the original series.
- $C26_a$ (AB2_cI36_199_b_c) was set in space group $I2_13$ #199. Hermann noted that this structure has a very short distance (1.88 Å) between oxygen atoms on different NO_2 molecules, and that this structure does not form the $(NO_2)_2$ aggregate molecule found in the $C26_b$ structure, making "making this proposed structure very unlikely."
- Recognizing this, (Hendricks, 1931) suggested that NO_2 was actually in space group $I23$ #197. (Hermann, 1997) gave this structure the $C26_b$ designation, but noted that based on Hendricks's atomic positions the space group was actually $Im\bar{3}$ #204.
- The modern accepted structure for NO_2 (AB2_cI36_204_d_g) is set in space group $Im\bar{3}$ #204, confirming Hendricks. We follow (Villars, 2005) and give this the *C*26 designation.
- We used the experimental data for this phase collected at 20 K.

Body-centered Cubic primitive vectors:

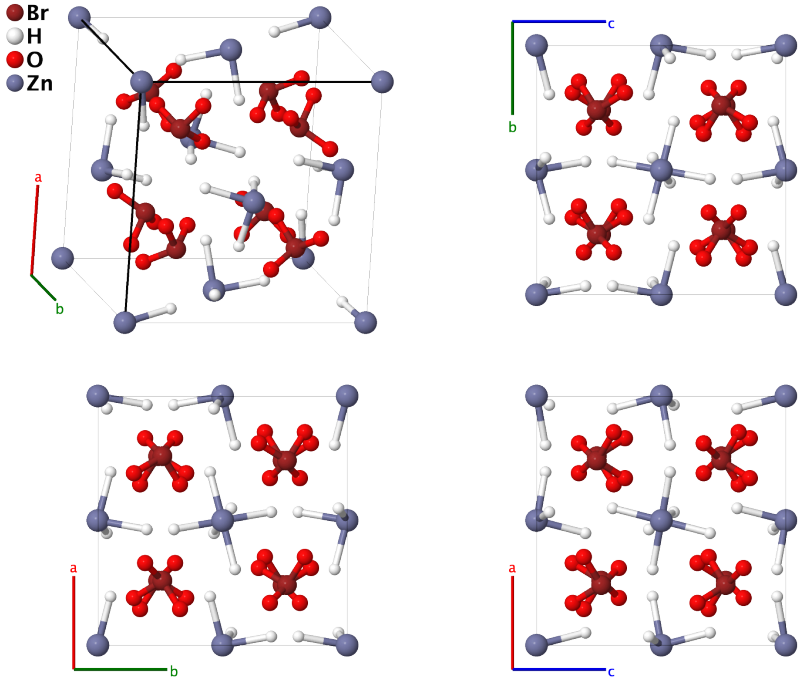
$Zn(BrO_3)_2{\cdot}6H_2O$ ($J1_{10}$) Structure: A2B6C6D_cP60_205_c_d_d_a

http://aflow.org/prototype-encyclopedia/A2B6C6D_cP60_205_c_d_d_a



Prototype	:	$Br_2(H_2O)_6O_6Zn$
AFLOW prototype label	:	A2B6C6D_cP60_205_c_d_d_a
***Strukturbericht* designation**	:	$J1_{10}$
Pearson symbol	:	cP60
Space group number	:	205
Space group symbol	:	$Pa\bar{3}$
AFLOW prototype command	:	`aflow --proto=A2B6C6D_cP60_205_c_d_d_a --params=`$a, x_2, x_3, y_3, z_3, x_4, y_4, z_4$

- The positions of the hydrogen atoms in the water molecules were not determined, so we only provide the positions of the oxygen atom (labeled as H_2O).

Simple Cubic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = a\,\hat{\mathbf{z}}$$

Prototype	:	$N_2(NH_3)_6NiO_6$
AFLOW prototype label	:	A2B6CD6_cP60_205_c_d_a_d
***Strukturbericht* designation**	:	$H6_4$
Pearson symbol	:	cP60
Space group number	:	205
Space group symbol	:	$Pa\bar{3}$
AFLOW prototype command	:	`aflow --proto=A2B6CD6_cP60_205_c_d_a_d --params=`$a, x_2, x_3, y_3, z_3, x_4, y_4, z_4$

- (Wyckoff, 1922) determined this approximate structure. In his paper, non-zero coordinates were $x_2 = 1/4$ for the nitrogen (8*c*) atoms, $x_3 = v$, "where v is somewhat less than 0.25," for the NH_3 (24*d*) molecules, and $x_4 = y_4 = 1/4$, $z_4 = v'$, where v' "should not deviate far from 0." If we take these coordinates as written the space group becomes $Fm\bar{3}m$ #225 rather than Wyckoff's $Pa\bar{3}$ #205, so we adjusted v and v' slightly to put the system in his space group.
- (Ewald, 1931) gave this the *Strukturbericht* designation $H61$, or $H6_1$ in later notation. (Hermann, 1937) moved it to $I1_4$ in their "list of type descriptions," but no other volume of *Strukturbericht* refers to it at all. Accordingly, we will designate this structure by its original label.
- This structure is an idealized appoximation to the true structure of $Ni(NO_3)_2(NH_3)_6$. (Bigoli, 1971) showed that the correct structure is triclinic, with space group $P\bar{1}$.
- The positions of the hydrogen atoms in the ammonia molecules were not determined, so we only provide the positions of the nitrogen atoms (labeled as NH_3).

Simple Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= a\,\hat{\mathbf{z}}\end{aligned}$$

- CaB_2O_4 exists in at least four phases (Marezio, 1969):
- I - The ground state, stable below 1.2 GPa, *Strukturbericht* $E3_2$.
- II – Orthorhombic high pressure structure, stable between 1.2 and 1.5 GPa, presumably calciborite.
- III – Orthorhombic high pressure structure, stable between 1.5 and 2.5 GPa.
- IV – Cubic high pressure structure, stable between 2.5 and 4.0 GPa (this structure).

- This is the pure fluorine end-point of the $NaSbF_{6-x}(OH)_x$ compounds. Although the replacement of fluoride by OH does not affect the shape of the Sb-$(F,OH)_6$ ions, it has a profound effect on the structure, as can be seen by looking at and $NaSb(OH)_6$ ($J1_{11}$) and $NaSbF_4(OH)_2$ ($J1_{12}$).

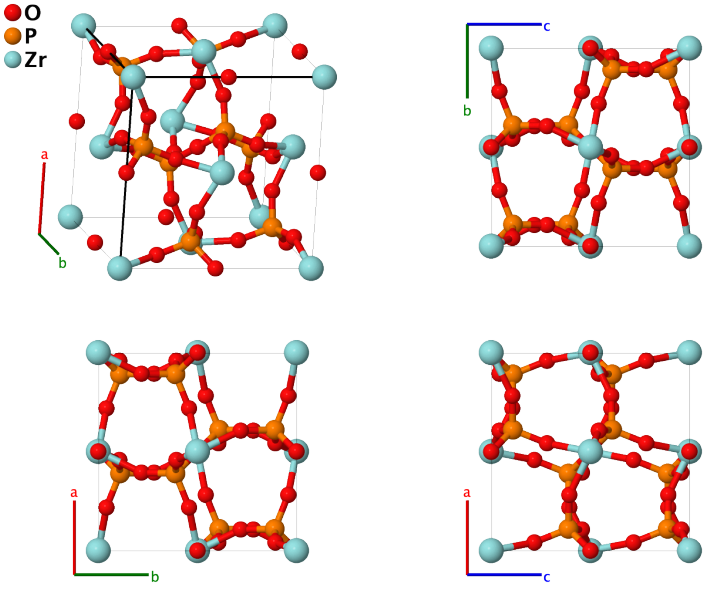
ZrP_2O_7 High-Temperature ($K6_1$) Structure: A7B2C_cP40_205_bd_c_a

http://aflow.org/prototype-encyclopedia/A7B2C_cP40_205_bd_c_a



Prototype	:	P_2O_7Zr
AFLOW prototype label	:	A7B2C_cP40_205_bd_c_a
***Strukturbericht* designation**	:	$K6_1$
Pearson symbol	:	cP40
Space group number	:	205
Space group symbol	:	$Pa\bar{3}$
AFLOW prototype command	:	`aflow --proto=A7B2C_cP40_205_bd_c_a --params=`a, x_3, x_4, y_4, z_4

Other compounds with this structure

- AB_2O_7, (A = Si, Ge, Sn, Pb, Ti, Zr, Hf, Mo, W, Re, Ce, U, *etc.*; B = P, V, As)

- This is the high temperature form of all the structures listed. The low temperature structure depends on the composition. Below 290 °C, ZrP_2O_7 transforms to an orthorhombic structure, space group *Pbca* #61, with 136 unique crystallographic positions and 1080 atomic sites. See (Birkedal, 2006) and (Stinton, 2006) for more details.

Simple Cubic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = a\,\hat{\mathbf{z}}$$

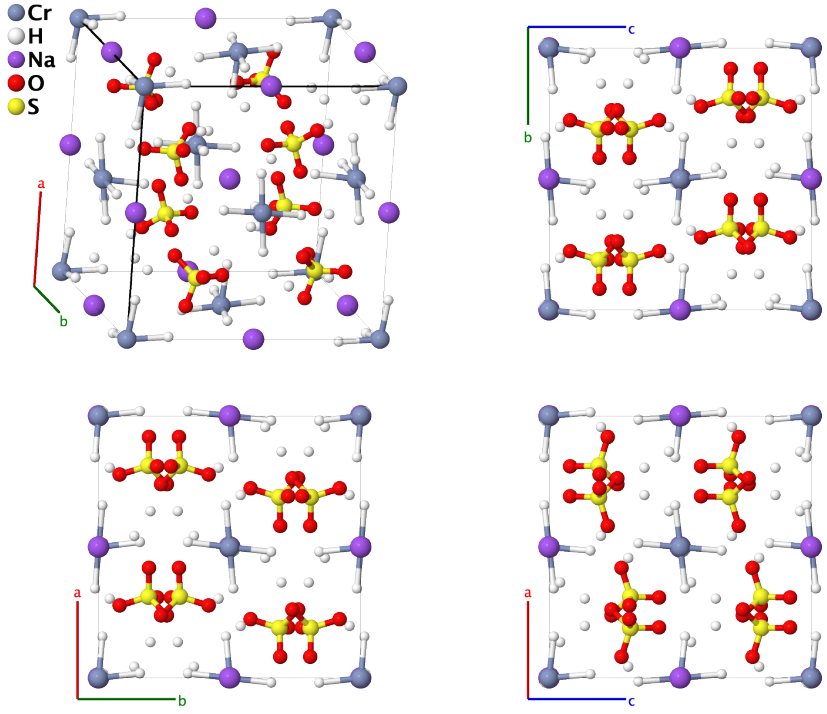
$NaCr(SO_4)_2{\cdot}12H_2O$ Alum Structure: AB12CD8E2_cP96_205_a_2d_b_cd_c

http://aflow.org/prototype-encyclopedia/AB12CD8E2_cP96_205_a_2d_b_cd_c



Prototype	:	$Cr(H_2O)_{12}NaO_8S_2$
AFLOW prototype label	:	AB12CD8E2_cP96_205_a_2d_b_cd_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	cP96
Space group number	:	205
Space group symbol	:	$Pa\bar{3}$
AFLOW prototype command	:	`aflow --proto=AB12CD8E2_cP96_205_a_2d_b_cd_c --params=`$a, x_3, x_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7$

Other compounds with this structure

- $CsCr(SO_4)_2{\cdot}12H_2O$

- The alums have the general formula $AB(XO_4)_2{\cdot}12H_2O$, where A is a monovalent ion, B is a trivalent ion, and X is a chalcogen. In most cases atom B is aluminum and atom X is sulfur, leading to the name alum.
- All alums have their room-temperature form in space group $Pa\bar{3}$ #205, but the bonding between the A and B ions and the XO_4 complex can be quite different.
- (Lipson, 1935ab) described three general forms of alum based on the sizes of the monovalent ions. Each of these forms was given a *Strukturbericht* designation by (Gottfried, 1937):
  - α-alum, with intermediate sized ions, prototype $KAl(SO_4)_2{\cdot}12H_2O$, $H4_{13}$,

  - β-alum, with large ions, prototype $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$, $H4_{14}$, and
  - γ-alum, with small ions, prototype $NaAl(SO_4)_2{\cdot}12H_2O$, $H4_{15}$.

- This classification scheme is not complete, *e.g.*, (Ledsham, 1968) points out that $NaCr(SO_4)_2{\cdot}12H_2O$ (this structure) does not fit into any of these categories, and that the actual structure depends on the combination of monovalent and trivalent ions.

- As noted above, the $Pa\overline{3}$ structures of alum are the room temperature form. As the temperature decreases the alum structure may transform. For example, in the temperature range 150-170 K the β-alum $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$ transforms into an orthorhombic structure with fully ordered NH_3CH_3 ions.

- The positions of the hydrogen atoms in the water molecules were not determined, so we only provide the positions of the oxygen atoms (labeled as H_2O).

Simple Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= a\,\hat{\mathbf{z}}\end{aligned}$$

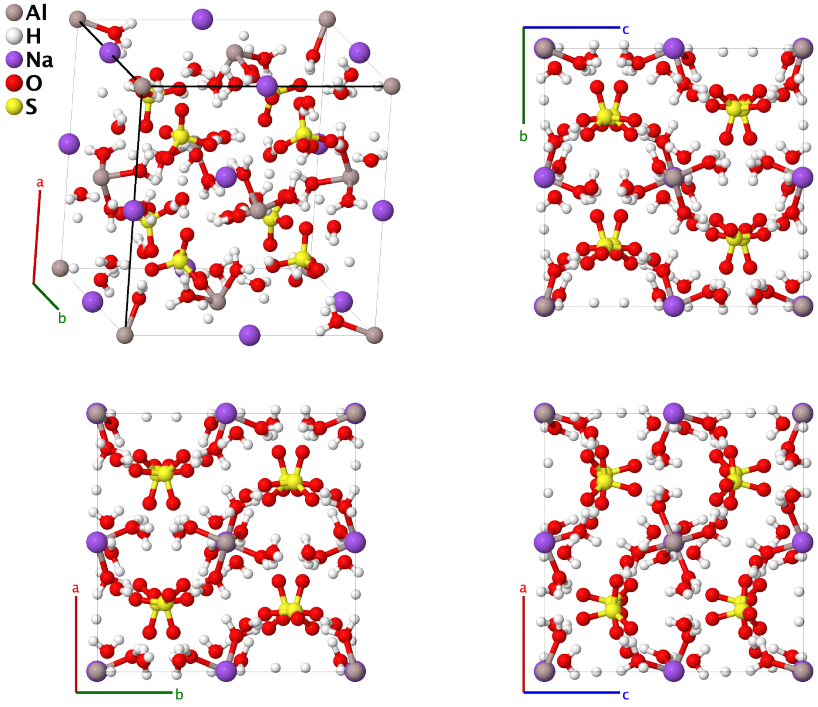
γ-Alum [$AlNa(SO_4)_2{\cdot}12H_2O$, $H4_{15}$] Structure: AB24CD20E2_cP192_205_a_4d_b_c3d_c

http://aflow.org/prototype-encyclopedia/AB24CD20E2_cP192_205_a_4d_b_c3d_c



Prototype	:	$AlH_{24}NaO_{20}S_2$
AFLOW prototype label	:	AB24CD20E2_cP192_205_a_4d_b_c3d_c
***Strukturbericht* designation**	:	$H4_{15}$
Pearson symbol	:	cP192
Space group number	:	205
Space group symbol	:	$Pa\bar{3}$
AFLOW prototype command	:	`aflow --proto=AB24CD20E2_cP192_205_a_4d_b_c3d_c --params=`$a, x_3, x_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}$

- The alums have the general formula $AB(XO_4)_2{\cdot}12H_2O$, where A is a monovalent ion, B is a trivalent ion, and X is a chalcogen. In most cases atom B is aluminum and atom X is sulfur, leading to the name alum.
- All alums have their room-temperature form in space group $Pa\bar{3}$ #205, but the bonding between the A and B ions and the XO_4 complex can be quite different.
- (Lipson, 1935ab) described three general forms of alum based on the sizes of the monovalent ions. Each of these forms was given a *Strukturbericht* designation by (Gottfried, 1937):
  - α-alum, with intermediate sized ions, prototype $KAl(SO_4)_2{\cdot}12H_2O$, $H4_{13}$,
  - β-alum, with large ions, prototype $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$, $H4_{14}$, and
  - γ-alum, with small ions, prototype $NaAl(SO_4)_2{\cdot}12H_2O$, $H4_{15}$ (this structure).

- This classification scheme is not complete, *e.g.*, (Ledsham, 1968) points out that $NaCr(SO_4)_2{\cdot}12H_2O$ does not fit into any of these categories, and that the actual structure depends on the combination of monovalent and trivalent ions.
- As noted above, the $Pa\bar{3}$ structures of alum are the room temperature form. As the temperature decreases the alum structure may transform. For example, in the temperature range 150-170 K the β-alum $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$ transforms into an orthorhombic structure with fully ordered NH_3CH_3 ions.

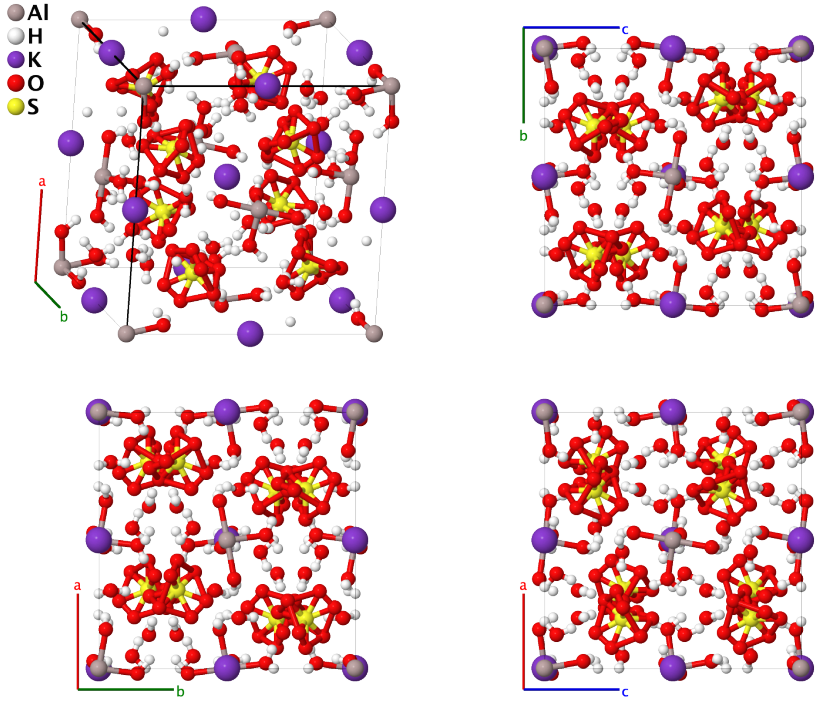
α-Alum [$KAl(SO_4)_2 \cdot 12H_2O$, $H4_{13}$] Structure: AB24CD28E2_cP224_205_a_4d_b_2c4d_c

http://aflow.org/prototype-encyclopedia/AB24CD28E2_cP224_205_a_4d_b_2c4d_c



Prototype	:	$AlH_{24}KO_{20}S_2$
AFLOW prototype label	:	AB24CD28E2_cP224_205_a_4d_b_2c4d_c
***Strukturbericht* designation**	:	$H4_{13}$
Pearson symbol	:	cP224
Space group number	:	205
Space group symbol	:	$Pa\bar{3}$
AFLOW prototype command	:	`aflow --proto=AB24CD28E2_cP224_205_a_4d_b_2c4d_c --params=`$a, x_3, x_4, x_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}$

Other compounds with this structure

- $NH_4Al(SO_4)_2 \cdot 12H_2O$, $KCr(SO_4)_2 \cdot 12H_2O$, $RbAl(SO_4)_2 \cdot 12H_2O$, and $KAl(SeO_4)_2 \cdot 12H_2O$

- The alums have the general formula $AB(XO_4)_2 \cdot 12H_2O$, where A is a monovalent ion, B is a trivalent ion, and X is a chalcogen. In most cases atom B is aluminum and atom X is sulfur, leading to the name alum.
- All alums have their room-temperature form in space group $Pa\bar{3}$ #205, but the bonding between the A and B ions and the XO_4 complex can be quite different.
- (Lipson, 1935ab) described three general forms of alum based on the sizes of the monovalent ions. Each of these forms was given a *Strukturbericht* designation by (Gottfried, 1937):
  - α-alum, with intermediate sized ions, prototype $KAl(SO_4)_2 \cdot 12H_2O$, $H4_{13}$ (this structure),

  - β-alum, with large ions, prototype $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$, $H4_{14}$, and
  - γ-alum, with small ions, prototype $NaAl(SO_4)_2{\cdot}12H_2O$, $H4_{15}$.

- This classification scheme is not complete, *e.g.*, (Ledsham, 1968) points out that $NaCr(SO_4)_2{\cdot}12H_2O$ does not fit into any of these categories, and that the actual structure depends on the combination of monovalent and trivalent ions.
- As noted above, the $Pa\bar{3}$ structures of alum are the room temperature form. As the temperature decreases the alum structure may transform. For example, in the temperature range 150-170 K the β-alum $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$ transforms into an orthorhombic structure with fully ordered NH_3CH_3 ions.
- (Ewald, 1931) designated the α-alum structure determined by (Cork, 1927) as $H4_2$, but when the superior structural determination of (Beevers, 1934) appeared this type was abandoned, and the new structure was given the designation $H4_{13}$. (Nyburg, 2000) were able to determine the positions of the hydrogen atoms, so we use their improved structure as our prototype.
- The oxygen atoms around the sulfur are statistically distributed in two ways: the probability of the O-I and O-III sites being occupied is 78.7%, while the probability of the O-II/O-IV combination being occupied is 21.3%.

Simple Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= a\,\hat{\mathbf{z}}\end{aligned}$$

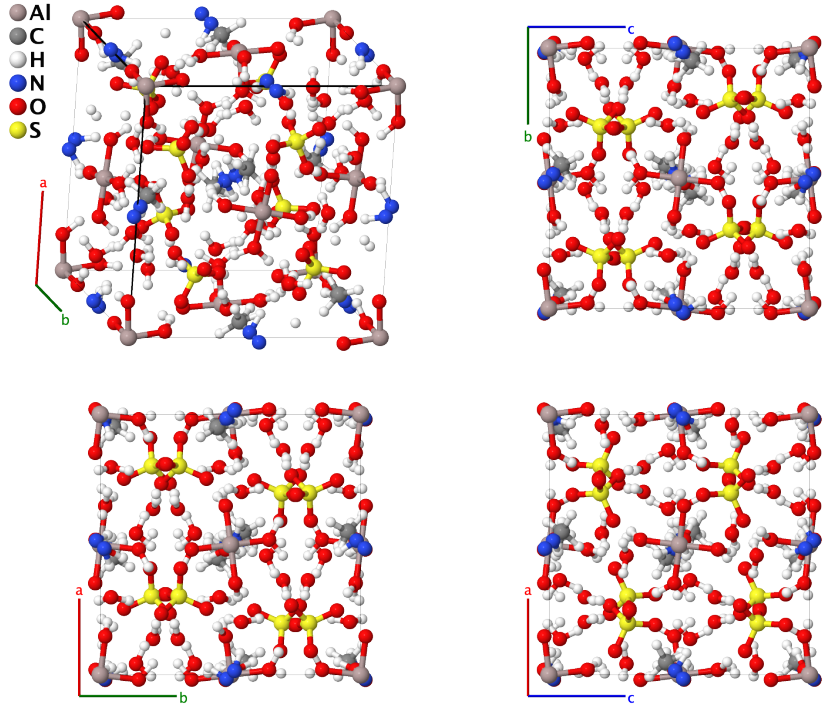
β-Alum [$Al(NH_3CH_3)_2(SO_4)_2{\cdot}12H_2O$, $H4_{14}$] Structure: AB2C36D2E20F2_cP252_205_a_c_6d_c_c3d_c

http://aflow.org/prototype-encyclopedia/AB2C36D2E20F2_cP252_205_a_c_6d_c_c3d_c



Prototype	:	$AlC_2H_{36}N_2O_{20}S_2$
AFLOW prototype label	:	AB2C36D2E20F2_cP252_205_a_c_6d_c_c3d_c
***Strukturbericht* designation**	:	$H4_{14}$
Pearson symbol	:	cP252
Space group number	:	205
Space group symbol	:	$Pa\bar{3}$
AFLOW prototype command	:	`aflow --proto=AB2C36D2E20F2_cP252_205_a_c_6d_c_c3d_c --params=`$a, x_2, x_3, x_4, x_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}$

Other compounds with this structure

- $AlCs(SO_4)_2{\cdot}12H_2O$

- The alums have the general formula $AB(XO_4)_2{\cdot}12H_2O$, where A is a monovalent ion, B is a trivalent ion, and X is a chalcogen. In most cases atom B is aluminum and atom X is sulfur, leading to the name alum.
- All alums have their room-temperature form in space group $Pa\bar{3}$ #205, but the bonding between the A and B ions and the XO_4 complex can be quite different.
- (Lipson, 1935ab) described three general forms of alum based on the sizes of the monovalent ions. Each of these forms was given a *Strukturbericht* designation by (Gottfried, 1937):
  - α-alum, with intermediate sized ions, prototype $KAl(SO_4)_2{\cdot}12H_2O$, $H4_{13}$,

  - β-alum, with large ions, prototype $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$, $H4_{14}$ (this structure), and
  - γ-alum, with small ions, prototype $NaAl(SO_4)_2{\cdot}12H_2O$, $H4_{15}$.

- This classification scheme is not complete, *e.g.*, (Ledsham, 1968) points out that $NaCr(SO_4)_2{\cdot}12H_2O$ does not fit into any of these categories, and that the actual structure depends on the combination of monovalent and trivalent ions.
- As noted above, the $Pa\bar{3}$ structures of alum are the room temperature form. As the temperature decreases the alum structure may transform. For example, in the temperature range 150-170 K the β-alum $(NH_3CH_3)Al(SO_4)_2{\cdot}12H_2O$ transforms into an orthorhombic structure with fully ordered NH_3CH_3 ions.
- This structure was originally determined by (Lipsom, 1935c), who could only determine that the NH_3CH_3 ion occupied the (4*b*) Wyckoff position. (Abdeen, 1981) showed that the ion was statistically distributed at two possible sites. The C-N bond distance is 1.4 Å, slightly smaller than the 1.51 Å distance observed in the low temperature structure. At any site, one of the two nitrogen positions is occupied, along with the carbon position 1.4 Å away. Six hydrogen positions from the (H-I) and (H-II) sites are then occupied.

Simple Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= a\,\hat{\mathbf{z}}\end{aligned}$$

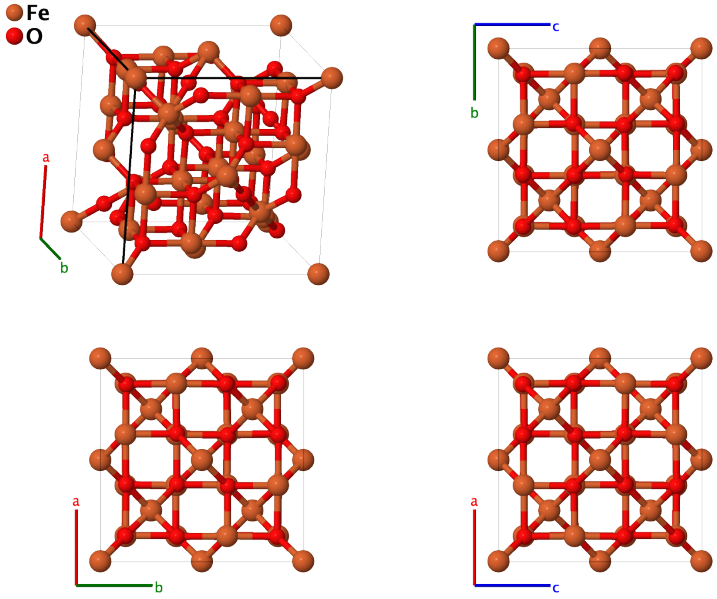
Maghemite (γ-Fe_2O_3, $D5_7$) Structure: A2B3_cP60_212_bcd_ace

http://aflow.org/prototype-encyclopedia/A2B3_cP60_212_bcd_ace



Prototype	:	Fe_2O_3
AFLOW prototype label	:	A2B3_cP60_212_bcd_ace
***Strukturbericht* designation**	:	$D5_7$
Pearson symbol	:	cP60
Space group number	:	212
Space group symbol	:	$P4_332$
AFLOW prototype command	:	`aflow --proto=A2B3_cP60_212_bcd_ace --params=`$a, x_3, x_4, y_5, x_6, y_6, z_6$

Other compounds with this structure

- γ-Al_2O_3 (γ-corundum)

- (Hermann, 1937) gives γ-Al_2O_3 as the prototype for *Strukturbericht* $D5_7$, but states that the data for γ-Fe_2O_3 is more reliable and presents the data for the latter compound, which we use as the prototype. This is a rock-salt ($B1$) structure with defects. This structure can also be expressed in the enantiomorphic space group $P4_132$ #213.

Simple Cubic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = a\,\hat{\mathbf{z}}$$

Prototype	:	$Al_{13}ClF_{18}O_{20}Si_5$
AFLOW prototype label	:	A13BC18D20E5_cF228_216_dh_b_fh_2eh_ce
***Strukturbericht* designation**	:	$S0_8$
Pearson symbol	:	cF228
Space group number	:	216
Space group symbol	:	$F\bar{4}3m$
AFLOW prototype command	:	`aflow --proto=A13BC18D20E5_cF228_216_dh_b_fh_2eh_ce --params=`$a, x_4, x_5, x_6, x_7, x_8, z_8, x_9, z_9, x_{10}, z_{10}$

- We use the structure proposed by (Kamb, 1960), a refinement of the original (Pauling, 1933) $S0_8$ structure. The only major difference is the y coordinate of the OH/F-I site, which is now at a more reasonable distance from the chlorine atom.
- For easy of visualization, we have used fluorine atoms to represent all of the $(OH,F)_{18}$ positions, but in reality the system is dominated by OH, not F. Kamb argues that the physics of hydrogen bonding makes it likely that the actual structure has composition $(OH)_{16}F_2$, with the fluorine atoms substituting for OH on the second ($48h$) site.

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}}$$

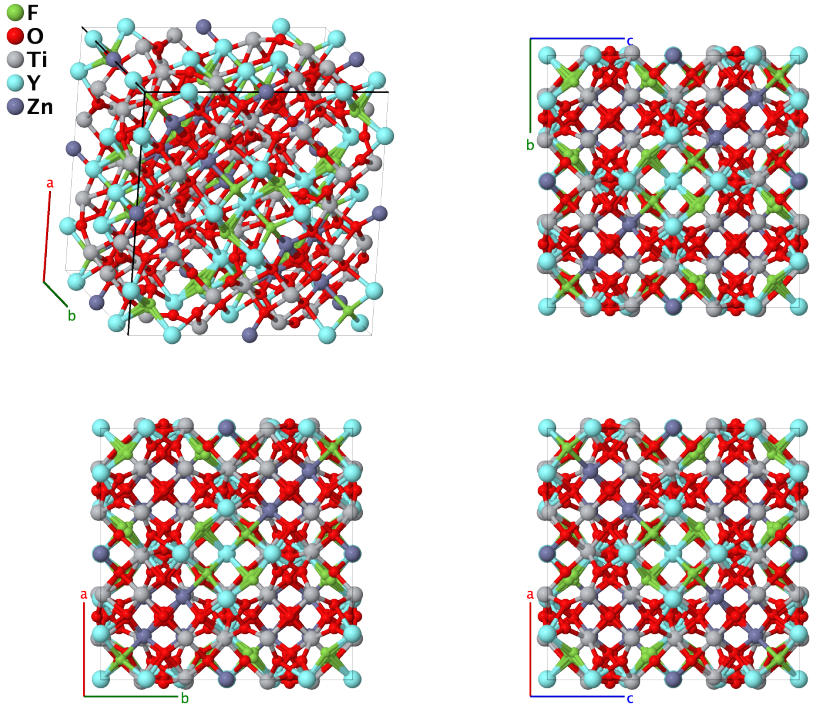
Murataite $[(Y,Na)_6(Zn,Fe)_5Ti_{12}O_{29}(O,F)_{10}F_4]$ Structure: A16B40C12D6E5_cF316_216_eh_e2g2h_h_f_be

http://aflow.org/prototype-encyclopedia/A16B40C12D6E5_cF316_216_eh_e2g2h_h_f_be



Prototype	:	$F_{16}O_{40}Ti_{12}Y_6Zn_5$
AFLOW prototype label	:	A16B40C12D6E5_cF316_216_eh_e2g2h_h_f_be
***Strukturbericht* designation**	:	None
Pearson symbol	:	cF316
Space group number	:	216
Space group symbol	:	$F\bar{4}3m$
AFLOW prototype command	:	`aflow --proto=A16B40C12D6E5_cF316_216_eh_e2g2h_h_f_be --params=`$a, x_2, x_3, x_4, x_5, x_6, x_7, x_8, z_8, x_9, z_9, x_{10}, z_{10}, x_{11}, z_{11}$

- Most of the sites in this structure are somewhat disordered. The "nominal" composition is given as $F_{16}O_{40}Ti_{12}Y_6Zn_5$ by (Ercit, 1995), but as the CIF in (Downs, 2003) shows, even these labels are not quite correct. In our listing we label each Wyckoff position by the type of atom that has the largest concentration on that site. Following (Downs, 2003):
  - Site Zn-I has the composition $Zn_{0.89}Si_{0.11}$.
  - Site F-I has the composition $F_{0.55}O_{0.45}$.
  - Site O-I is pure oxygen.
  - Site Zn-II has the composition $Zn_{0.48}Fe_{0.25}Na_{0.16}Ti_{0.11}$.
  - Site Y has the composition $Y_{0.37}Na_{0.35}Mn_{0.03}HREE_{0.25}$, where "HREE" is a mixture of heavy Rare Earth elements.
  - Site O-II is pure oxygen, but only 8.3333% of the sites are occupied.
  - Site O-III has the composition $O_{0.7}F_{0.3}$.

- Site O-IV is pure oxygen.
- Site O-V is pure oxygen, but only 87% of the sites are occupied.
- Site F-II is pure fluorine, but only 33.333% of the sites are occupied.
- Site Ti has the composition $Ti_{0.76}Nb_{0.13}Na_{0.11}$.

Face-centered Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}}\end{aligned}$$

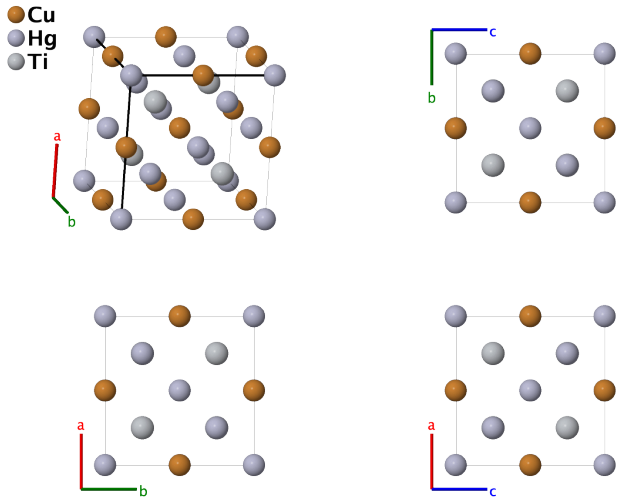
Hg_2TiCu Inverse Heusler Structure: AB2C_cF16_216_b_ad_c

http://aflow.org/prototype-encyclopedia/AB2C_cF16_216_b_ad_c



Prototype	:	$CuHg_2Ti$
AFLOW prototype label	:	AB2C_cF16_216_b_ad_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	cF16
Space group number	:	216
Space group symbol	:	$F\bar{4}3m$
AFLOW prototype command	:	`aflow --proto=AB2C_cF16_216_b_ad_c --params=`a

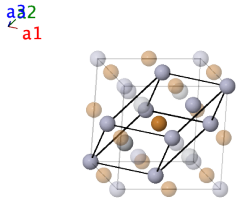
Other compounds with this structure

- Mn_2CoAl, Mn_2CoGa, Mn_2CoIn, Li_2AgSb, Li_2CuSn, Li_2CuSb, Li_2AgAl, Li_2AgIn, Li_2AgSb, Li_2AgSn, Li_2AgPb, Li_2AgBi, Li_2AuGa, Li_2AuIn, Li_2AuSb, Li_2AuSn, Li_2AuPb, and Li_2AuTl

- Most of the literature on Inverse Heusler compounds identifies Hg_2TiCu as the prototype structure, however (Villars, 2016) and (Villars, 2016a) use the Li_2AgSb structure found in (Pauly, 1968) as the prototype. Although it is tempting to use the older paper, we follow the majority and use Hg_2TiCu as the prototype.
- The inverse Heusler structure is a variation of the Quaternary Heusler structure, where the mercury atoms are on adjacent face-centered cubic sublattices, forming a diamond structure. Contrast this with the standard Heusler ($L1_2$) structure, where the like atoms are at second-neighbor positions in the fcc lattice.
- This structure is also referred to as the XA or X_a structure.

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type

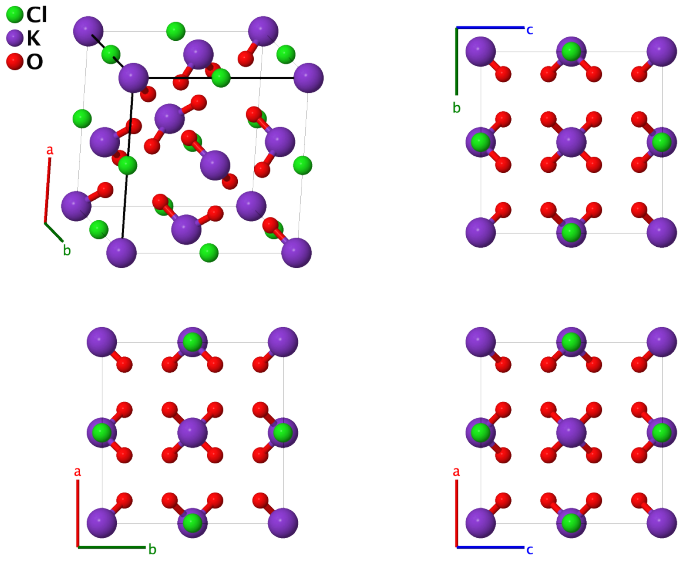
High-Temperature Cubic $KClO_4$ ($H0_5$) Structure: ABC4_cF24_216_b_a_e

http://aflow.org/prototype-encyclopedia/ABC4_cF24_216_b_a_e



Prototype	:	$ClKO_4$
AFLOW prototype label	:	ABC4_cF24_216_b_a_e
***Strukturbericht* designation**	:	$H0_5$
Pearson symbol	:	cF24
Space group number	:	216
Space group symbol	:	$F\bar{4}3m$
AFLOW prototype command	:	`aflow --proto=ABC4_cF24_216_b_a_e --params=`a, x_3

Other compounds with this structure

- $NaClO_4$, $RbClO_4$, $CsClO_4$, NH_4ClO_4, $AgClO_4$, and $TlClO_4$

- This is the high-temperature phase of the listed perchlorate structures. $KClO_4$ transforms from its ground-state orthorhombic structure, $H0_2$ into this structure at 299.5 °C. The transition temperature for the other compounds range from 155 °C ($AgClO_4$) to 308 °C ($NaClO_4$).
- The lattice constant for $KClO_4$ was measured at 310 °C.

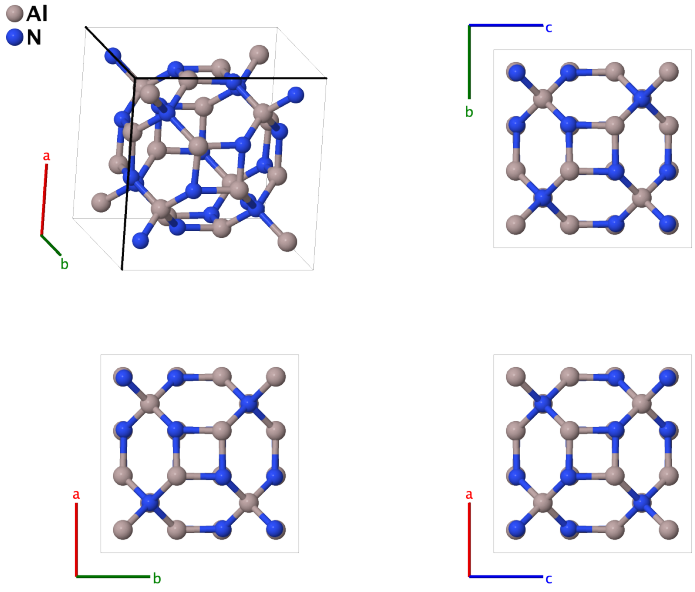
AlN (cF40) Structure: AB_cF40_216_de_ce

http://aflow.org/prototype-encyclopedia/AB_cF40_216_de_ce



Prototype	:	AlN
AFLOW prototype label	:	AB_cF40_216_de_ce
***Strukturbericht* designation**	:	None
Pearson symbol	:	cF40
Space group number	:	216
Space group symbol	:	$F\bar{4}3m$
AFLOW prototype command	:	`aflow --proto=AB_cF40_216_de_ce --params=`a, x_3, x_4

- AlN naturally occurs in two forms (Liu, 2019): the stable wz-AlN wurtzite ($B4$) structure, and the high-pressure rs-AlN rock salt ($B1$) structure. A metastable zb-AlN zincblende (zb-AlN) structure can be synthesized via a solid-state reaction.
- (Liu, 2019) used a first-principles evolutionary technique to find four possible metastable phases: one in the SC16 structure, and three novel cubic structures, cF40, cI16, and cI24.

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}a\,\hat{\mathbf{z}}$$

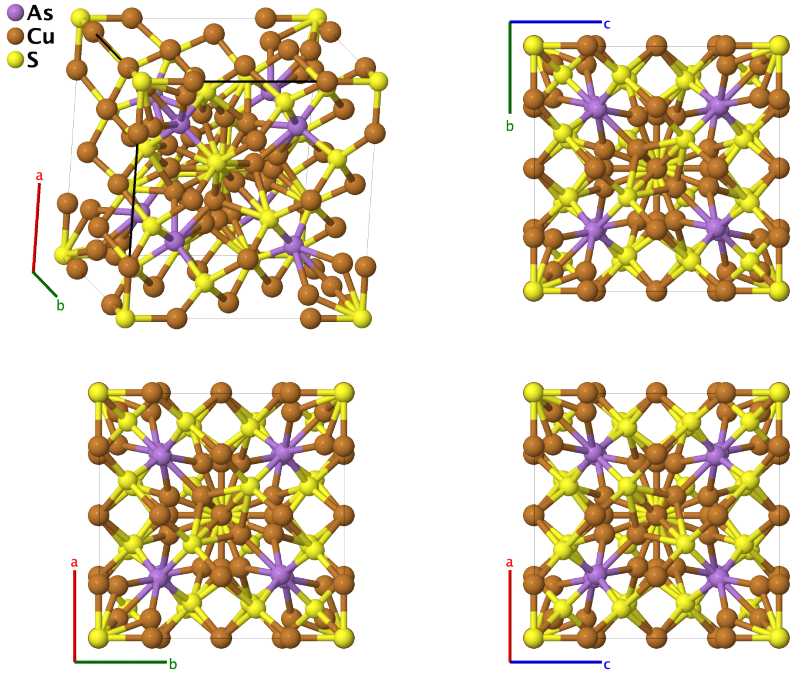
Tennantite ($Cu_{12}As_4S_{13}$) Structure: A4B24C13_cI82_217_c_deg_ag

http://aflow.org/prototype-encyclopedia/A4B24C13_cI82_217_c_deg_ag



Prototype	:	$As_4Cu_{12}S_{13}$
AFLOW prototype label	:	A4B24C13_cI82_217_c_deg_ag
***Strukturbericht* designation**	:	None
Pearson symbol	:	cI82
Space group number	:	217
Space group symbol	:	$I\bar{4}3m$
AFLOW prototype command	:	`aflow --proto=A4B24C13_cI82_217_c_deg_ag --params=`$a, x_2, x_4, x_5, z_5, x_6, z_6$

Other compounds with this structure

- $Cu_{14}Sb_4S_{13}$ (tetrahedrite)

- The Cu-II ($12e$) site is only occupied 75.8% of the time, and the Cu-III site is occupied 12.1% of the time, so that these sites only contain twelve atoms.
- Searching (Downs, 2003) shows that natural samples often have antimony substituting for arsenic. The antimony structures (tetrahedrites) contain higher concentrations of copper.
- The AFLOW label models the structure as if the sites were fully occupied.

Body-centered Cubic primitive vectors:

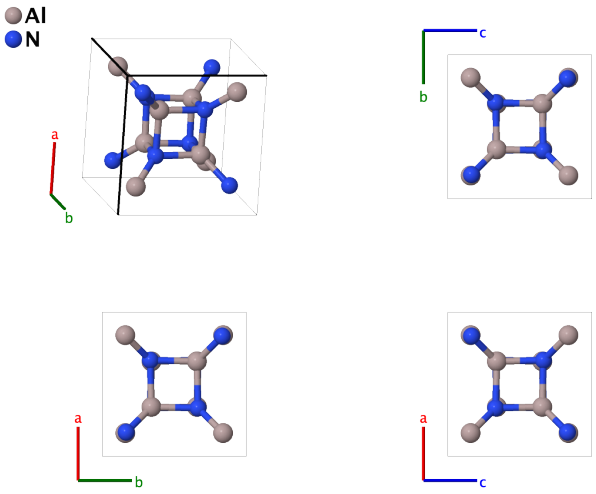
AlN (cI16) Structure: AB_cI16_217_c_c

http://aflow.org/prototype-encyclopedia/AB_cI16_217_c_c

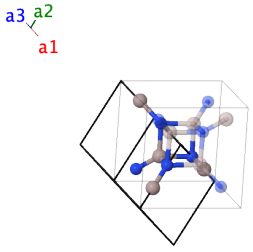


Prototype	:	AlN
AFLOW prototype label	:	AB_cI16_217_c_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	cI16
Space group number	:	217
Space group symbol	:	$I\bar{4}3m$
AFLOW prototype command	:	`aflow --proto=AB_cI16_217_c_c --params=`a, x_1, x_2

- AlN naturally occurs in two forms (Liu, 2019): the stable wz-AlN wurtzite ($B4$) structure, and the high-pressure rs-AlN rock salt ($B1$) structure. A metastable zb-AlN zincblende (zb-AlN) structure can be synthesized via a solid-state reaction.
- (Liu, 2019) used a first-principles evolutionary technique to find four possible metastable phases: one in the SC16 structure, and three novel cubic structures, cF40, cI16, and cI24.

Body-centered Cubic primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} - \tfrac{1}{2}a\,\hat{\mathbf{z}}$$



Basis vectors:

	Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$ =	$2x_1\,\mathbf{a}_1 + 2x_1\,\mathbf{a}_2 + 2x_1\,\mathbf{a}_3$	=	$x_1 a\,\hat{\mathbf{x}} + x_1 a\,\hat{\mathbf{y}} + x_1 a\,\hat{\mathbf{z}}$	($8c$)	Al

- (Gottfried, 1937) used the work of (Machatschki, 1934) for *Strukturbericht* label $S6_9$. We have used the updated 153 K data of (Hassan, 1991).
- (Machatschki, 1934) puts the sodium, calcium, and potassium atoms at the same (8*e*) Wyckoff position, with partial occupancies of approximately $Na_{0.75}Ca_{0.25}$ and a trace of potassium. The sample studied by (Hassan, 1991) was found to have the three atoms at slightly different (8*e*) positions, with 54% sodium occupation, 30% calcium occupation, and 20% potassium occupation.
- (Machatschki, 1934) put the sulfur atom at the origin, Wyckoff position (2*a*), and assumed that there were two SO_4 molecules per formula unit. (Hassan, 1991) found that there were statistically only 1.5 molecules per formula unit, and that the sulfur atom was slightly displaced from the origin to a (8*e*) site, where each atomic position was occupied only 19% of the time. The corresponding (8*e*) oxygen site (O-I in our notation, O2 in Hassan) is only occupied 75% of the time to maintain the SO_4 stoichiometry.
- We shifted the origin of (Hassan, 1991) so that the resulting atomic positions are close to those reported by (Machatschki, 1934). The latter structure can be recovered from the former by moving all of the sodium, calcium,

and potassium atoms to the same Wyckoff position, moving the sulfur atom to the origin, Wyckoff position ($2a$), and adjusting the occupation of each site appropriately.

- The 153K data presented in (Downs, 2003) has errors in the z coordinates of the CaC2 (our Ca) and O2 (our O-I) atoms. In both cases, the z coordinate should be the same as the x and y coordinates.
- The AFLOW label models the structure as if the sites were fully occupied.

Prototype	:	$Al_{14}Ca_{12}O_{33}$
AFLOW prototype label	:	A7B12C19_cI152_220_bc_2d_ace
***Strukturbericht* designation**	:	$K7_4$
Pearson symbol	:	cI152
Space group number	:	220
Space group symbol	:	$I\bar{4}3d$
AFLOW prototype command	:	`aflow --proto=A7B12C19_cI152_220_bc_2d_ace --params=`$a, x_3, x_4, x_5, x_6, x_7, y_7, z_7$

- We present the structure determined by (Boysen, 2007) with data taken at 293 K. This slightly differs from the original determination of (Büssem, 1936), which was given the $K7_4$ designation by (Gottfried, 1938). In the original work, the calcium atoms were thought to be located at a single (24*d*) site. Newer findings show that calcium is split between two (24*d*) sites, with the site we have labeled Ca-I having 87.5% of the atoms and Ca-II the remainder, although presumably only one of the two sites is occupied in any pair.
- In all works the O-I (12*a*) site is only partially occupied: if this is occupied 1/6 of the time, we get the proper stoichiometry, though (Boysen, 2007) found the occupation was 0.251 at 293 K, dropping as the temperature decreased.
- This structure is often referred to in the literature as C12A7, to distinguish it from other CaO/Al_2O_3 compounds.

Body-centered Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} - \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\end{aligned}$$

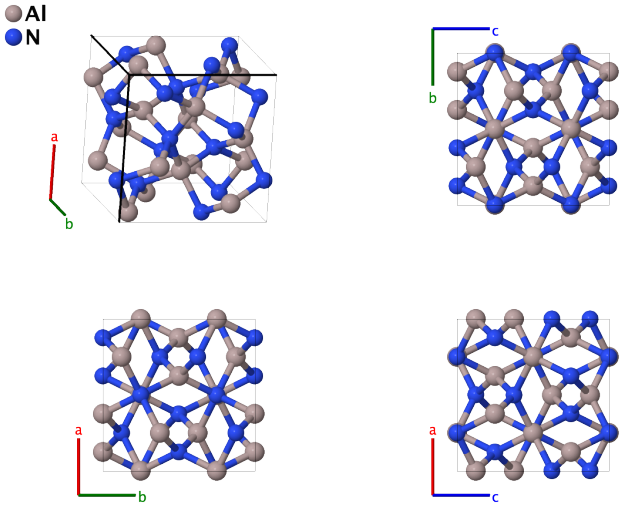
AlN (cI24) Structure: AB_cI24_220_a_b

http://aflow.org/prototype-encyclopedia/AB_cI24_220_a_b

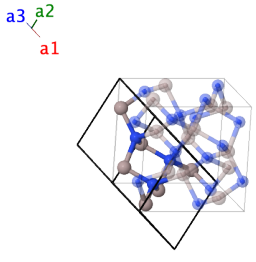


Prototype	:	AlN
AFLOW prototype label	:	AB_cI24_220_a_b
***Strukturbericht* designation**	:	None
Pearson symbol	:	cI24
Space group number	:	220
Space group symbol	:	$I\bar{4}3d$
AFLOW prototype command	:	`aflow --proto=AB_cI24_220_a_b --params=`a

- AlN naturally occurs in two forms (Liu, 2019): the stable wz-AlN wurtzite ($B4$) structure, and the high-pressure rs-AlN rock salt ($B1$) structure. A metastable zb-AlN zincblende (zb-AlN) structure can be synthesized via a solid-state reaction.
- (Liu, 2019) used a first-principles evolutionary technique to find four possible metastable phases: one in the SC16 structure, and three novel cubic structures, cF40, cI16, and cI24.

Body-centered Cubic primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} - \tfrac{1}{2}a\,\hat{\mathbf{z}}$$



Basis vectors:

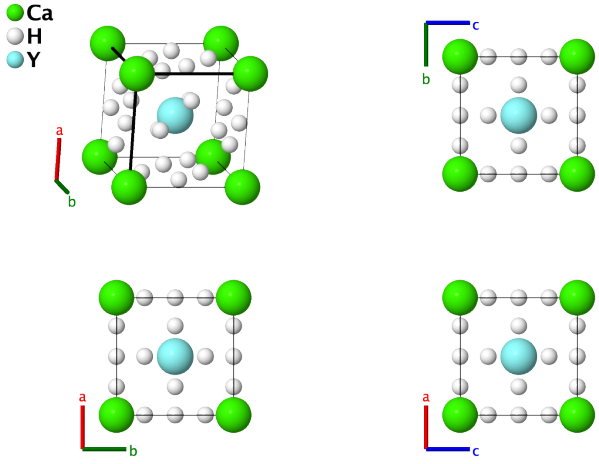
Predicted High-Pressure $YCaH_{12}$ Structure: AB12C_cP14_221_a_h_b

http://aflow.org/prototype-encyclopedia/AB12C_cP14_221_a_h_b



Prototype	:	$CaH_{12}Y$
AFLOW prototype label	:	AB12C_cP14_221_a_h_b
***Strukturbericht* designation**	:	None
Pearson symbol	:	cP14
Space group number	:	221
Space group symbol	:	$Pm\bar{3}m$
AFLOW prototype command	:	`aflow --proto=AB12C_cP14_221_a_h_b --params=`a, x_3

- This structure was determined by *ab initio* methods and is predicted to be stable in the pressure range 180-257 GPa, with T_c = 230 K at 180 GPa. We show the predicted structure at 200 GPa.

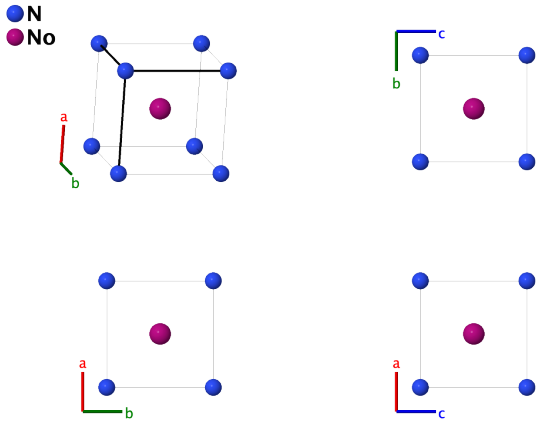
NH_4NO_3 I ($G0_8$) Structure: AB_cP2_221_a_b

http://aflow.org/prototype-encyclopedia/AB_cP2_221_a_b.NH4.NO3



Prototype	:	NH_4NO_3
AFLOW prototype label	:	AB_cP2_221_a_b
***Strukturbericht* designation**	:	$G0_8$
Pearson symbol	:	cP2
Space group number	:	221
Space group symbol	:	$Pm\bar{3}m$
AFLOW prototype command	:	`aflow --proto=AB_cP2_221_a_b --params=`a

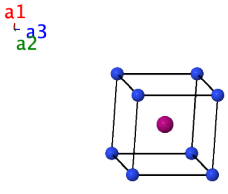
- Ammonium Nitrate exists in a variety of forms, (Hermann, 1937) depending on the temperature:

Phase	Temperature °C	*Strukturbericht*	Page	
I	125 – 170	$G0_8$	AB_cP2_221_a_b.NH4.NO3	(this structure)
II	84 – 125	$G0_9$	ABC3_tP10_100_b_a_bc	
III	32 – 84	$G0_{10}$	ABC3_oP20_62_c_c_cd.N.NH4.O	
IV	-17 – 32	$G0_{11}$	A4B2C3_oP18_59_ef_ab_af	
V	< −17	Gwihabaite	A4B2C3_tP72_77_8d_ab2c2d_6d2	

- In the $G0_8$ structure, both the NH_4^+ and NO_3^- ions rotate freely about their centers of mass (Kracek, 1931). The two ions sit on the same sites as atoms in the CsCl ($B2$) structure.

Simple Cubic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = a\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	$(1a)$	NH_4
$\mathbf{B}_2$	=	$\frac{1}{2}\,\mathbf{a}_1 + \frac{1}{2}\,\mathbf{a}_2 + \frac{1}{2}\,\mathbf{a}_3$	=	$\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}a\,\hat{\mathbf{z}}$	$(1b)$	NO_3

AFLOW prototype command	:	`aflow --proto=A27B52CD12_cP184_224_dl_eh3k_a_k --params=`$a, x_3, x_4, x_5, z_5, x_6, z_6, x_7, z_7, x_8, z_8, x_9, y_9, z_9$

- (Brown, 1977) presents this as an improvement on the $H4_{16}$ structure, $H_3PW_{12}O_{40}\cdot 5H_2O$. The primary difference is the addition of a sixth water molecule and the location of the hydrogen molecules not directly attached to a water molecule.
- The water molecules are formed by the H-II and O-II atoms, and the (24*h*) (O-II) and (48*l*) (H-II) Wyckoff sites are only occupied half of the time. Presumably this means that the nearly flat H-O molecular ions in this structure actually consist of one water molecule, the central hydrogen atom (H-I), and a water molecule on the other side of the central hydrogen, with the other water positions empty. Exactly which water molecules are occupied on around each H-I atom is completely up to chance. (Brown, 1977) state that the molecule has a positive charge, and write it as $H_5O_2^+$.
- We use the neutron data from (Brown, 1977) to locate the non-hydrogen atoms.
- This structure is a partially dehydrated form of $H_3PW_{12}O_{40}\cdot 29H_2O$ ($H4_{21}$). Further dehydration produces the $H_3PW_{12}O_{40}\cdot 3H_2O$ structure.

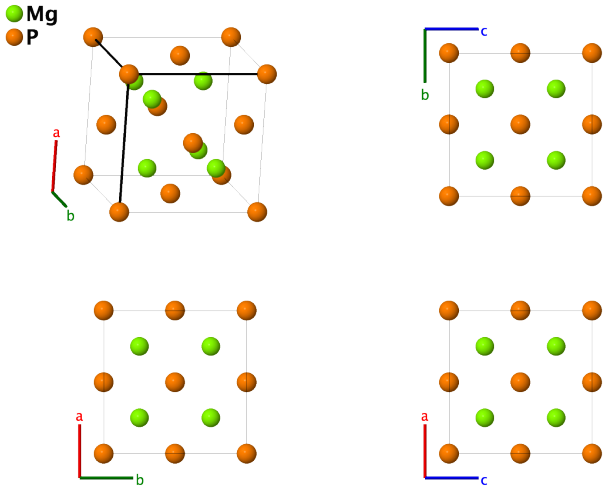
Mg_3P_2 ($D5_5$) Structure: A3B2_cP10_224_d_b

http://aflow.org/prototype-encyclopedia/A3B2_cP10_224_d_b



Prototype	:	Mg_3P_2
AFLOW prototype label	:	A3B2_cP10_224_d_b
***Strukturbericht* designation**	:	$D5_5$
Pearson symbol	:	cP10
Space group number	:	224
Space group symbol	:	$Pn\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A3B2_cP10_224_d_b --params=`a

Other compounds with this structure

- Al_3P_2, Cd_3P_2, Zn_3P_2, Mg_3As_2, Zn_3As_2, and Ag_2O_3

- (Parthé, 1993) lists As_2O_3 as the prototype for $D5_5$.
- (Passerini, 1928) gives the atomic positions in setting 1 of space group $Pn\bar{3}m$ #224. We have shifted this to the standard, setting 2.

AFLOW prototype label	:	A5B40CD12_cP116_224_cd_e3k_a_k
***Strukturbericht* designation**	:	$H4_{16}$
Pearson symbol	:	cP116
Space group number	:	224
Space group symbol	:	$Pn\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A5B40CD12_cP116_224_cd_e3k_a_k --params=`$a, x_4, x_5, z_5, x_6, z_6, x_7, z_7, x_8, z_8$

- This structure is a bit problematic. (Brown, 1977) offers evidence that the true structure of the hydrated phosphotungstic acid is $H_3PW_{12}O_{40}{\cdot}6H_2O$, rather than $5H_2O$ as deduced by (Keggin, 1934). The presence of the extra water molecule does change the structure somewhat, and Keggin does not give the positions of the hydrogen atoms not attached to water molecules. Ordinarily we would mark this structure obsolete, but it is possible to remove water molecules from this structure and still have a molecule that is recognizably related to the acid, as in $H_3PW_{12}O_{40}{\cdot}3H_2O$. In addition, the lattice constant reported by Keggin is 12.141 Å compared to Brown's 12.506 Å, a change consistent with the loss of a water molecule. Given this, we will not deprecate this five-water molecule structure.
- (Gottfried, 1937) does not give the positions of the water molecules, and they reverse the x and z coordinates for O-IV and W.
- This structure is a partially dehydrated form of $H_3PW_{12}O_{40}{\cdot}29H_2O$ ($H4_{21}$). Further dehydration produces the $H_3PW_{12}O_{40}{\cdot}3H_2O$ structure.

- The positions of the three hydrogen atoms are unknown. If we follow (Marosi, 2000), then the 'free' hydrogens are likely to be bound to some of the water molecules, giving the unusual stoichiometry in the prototype.

Simple Cubic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = a\,\hat{\mathbf{z}}$$

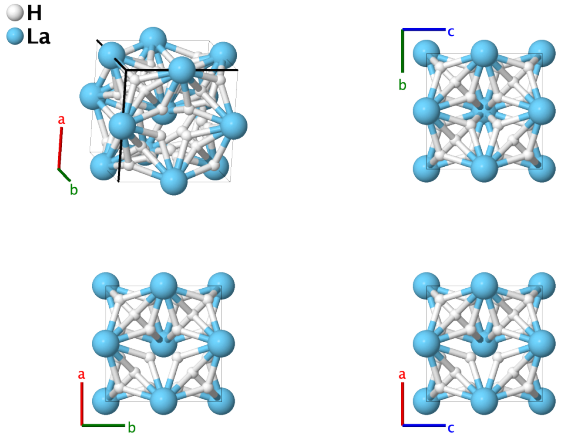
LaH_{10} High-T_c Superconductor Structure: A10B_cF44_225_cf_b

http://aflow.org/prototype-encyclopedia/A10B_cF44_225_cf_b



Prototype	:	$H_{10}La$
AFLOW prototype label	:	A10B_cF44_225_cf_b
***Strukturbericht* designation**	:	None
Pearson symbol	:	cF44
Space group number	:	225
Space group symbol	:	$Fm\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A10B_cF44_225_cf_b --params=`a, x_3

- This structure was predicted by (Liu, 2017) as a possible near-room-temperature superconductor at pressures above 200 GPa. Its existence was confirmed by (Geballe, 2018).
- The lattice constant a = 4.78 Å is taken from (Liu, 2017) prediction at 300 GPa. (Geballe, 2018) found a = 5.09 Å at 172 GPa.
- (Liu, 2017) give a list of hydrogen positions which are not compatible with space group $Fm\bar{3}m$ #225. The positions we assigned are consistent with the work of (Geballe, 2018).

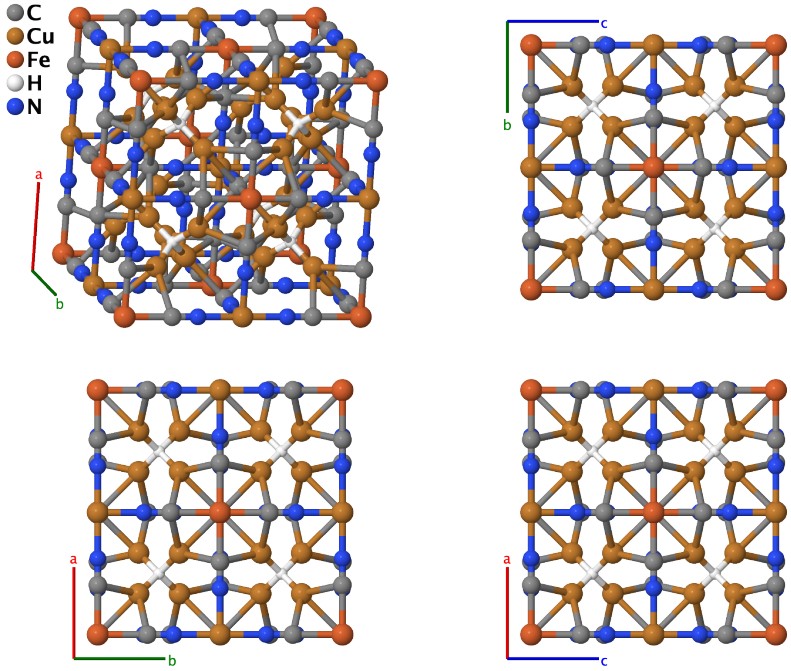
$Cu_3[Fe(CN)_6]_2{\cdot}xH_2O$ ($J2_5$, $x \approx 3$) Structure: A6B9CD2E6_cF96_225_e_bf_a_c_e

http://aflow.org/prototype-encyclopedia/A6B9CD2E6_cF96_225_e_bf_a_c_e



Prototype	:	$C_{12}Cu_3Fe_2(H_2O)_xN_{12}$
AFLOW prototype label	:	A6B9CD2E6_cF96_225_e_bf_a_c_e
***Strukturbericht* designation**	:	$J2_5$
Pearson symbol	:	cF96
Space group number	:	225
Space group symbol	:	$Fm\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A6B9CD2E6_cF96_225_e_bf_a_c_e --params=`a, x_4, x_5, x_6

Other compounds with this structure

- $Cd_3[Co(CN)_6]_2$, $Co_3[Co(CN)_6]_2$, $Cu_3[Fe(CN)_6]_2$, $Fe_3[Fe(CN)_6]_2$, $Td_3[Fe(CN)_6]_2$, and $Zn_3[Fe(CN)_6]_2$

- These compounds form a class called "Prussian Blue Analogs," where Prussian Blue is $Fe_3[Fe(CN)_6]_2$.
- (van Bever, 1938) studied what he believed to be the hydrated form of this structure, with $x \approx 3$. In that case, the water molecules occupy the ($8c$) sites, but each site is only occupied 75% of the time. The water sites are surrounded by a tetrahedron of copper ($32f$) sites, but only 6.25% of these sites are occupied.
- (Weiser, 1942) studied the anhydrous form. They found that in this case the copper atoms that were on the ($32f$) sites replace the water molecules on the ($8c$) site, and this site is now fully occupied with copper.
- To convert from the hydrated to anhydrous structure, remove the copper atoms from the ($32f$) sites in the CIF or POSCAR file, and relabel the ($8c$) site as copper.

- For a picture of the resulting structure see (Jiao, 2017).
- The AFLOW label models the structure as if the sites were fully occupied.

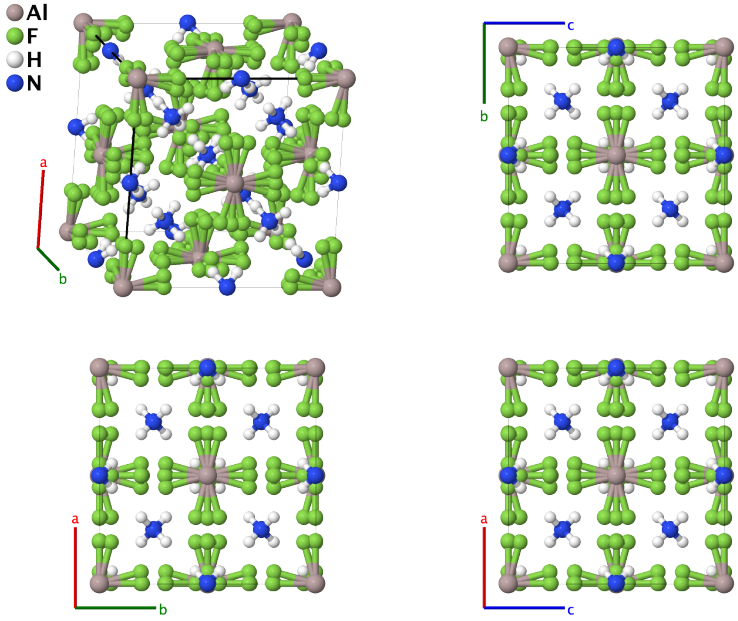
$(NH_4)_3AlF_6$ ($J2_1$) Structure: AB30C16D3_cF200_225_a_ej_2f_bc

http://aflow.org/prototype-encyclopedia/AB30C16D3_cF200_225_a_ej_2f_bc



Prototype	:	$AlF_6H_{12}N_3$
AFLOW prototype label	:	AB30C16D3_cF200_225_a_ej_2f_bc
***Strukturbericht* designation**	:	$J2_1$
Pearson symbol	:	cF200
Space group number	:	225
Space group symbol	:	$Fm\bar{3}m$
AFLOW prototype command	:	`aflow --proto=AB30C16D3_cF200_225_a_ej_2f_bc --params=`$a, x_4, x_5, x_6, y_7, z_7$

Other compounds with this structure

- $(NH_4)_3FeF_6$, $(NH_4)_3TiOF_5$, $(NH_4)_3Fe(NO_2)_6$, $K_3Ir(NO_2)_6$, $Cs_3Ir(NO_2)_6$, $Rb_3Ir(NO_2)_6$, and $Tl_3Ir(NO_2)_6$

- Early determinations of this structure placed all of the fluorine atoms on the (24*e*) site and were not able to determine the positions of the hydrogen atoms in the ammonium ion. This structure was designated $H71$ ($H7_1$) by (Ewald, 1931), renamed $I2_1$ by (Hermann, 1937) and finally given the label $J2_1$ by (Gottfried, 1937).

- The structure determined by (Udovenko, 2003) found that the fluorine atoms are split onto two sites, F-I, on Wyckoff position (24*e*) is 1/3 filled, and F-II, on (96*j*) is 1/6 filled. The positions are so close, however, that a reasonable approximation can be made by eliminating the (96*j*) site and fully occupying the (24*e*) site. The H-I (32*f*) site is fully occupied, while the H-II (32*f*) site is 50% occupied.

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}$$

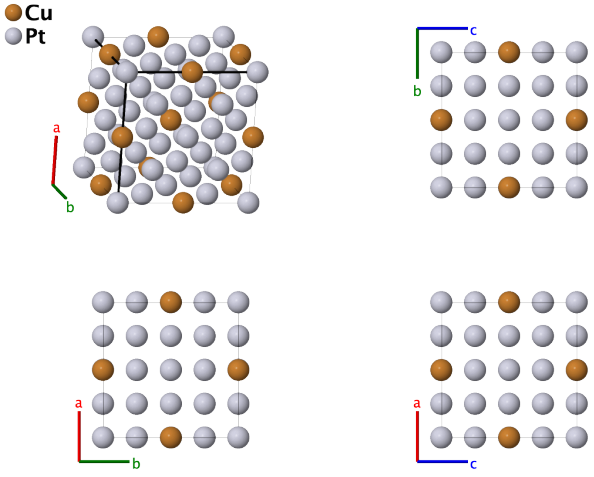
$L1_a$ (disputed $CuPt_3$) Structure: AB7_cF32_225_b_ad

http://aflow.org/prototype-encyclopedia/AB7_cF32_225_b_ad



Prototype	:	$CuPt_3$
AFLOW prototype label	:	AB7_cF32_225_b_ad
***Strukturbericht* designation**	:	$L1_a$
Pearson symbol	:	cF32
Space group number	:	225
Space group symbol	:	$Fm\bar{3}m$
AFLOW prototype command	:	`aflow --proto=AB7_cF32_225_b_ad --params=`a

- According to (Tang, 1951), the (24*d*) sites have the composition $Pt_{0.8}Cu_{0.2}$ in stoichiometric $CuPt_3$. Here we use "Pt" to specify the atoms on this site.
- (Tang, 1951) states that the crystal structure of $CuPt_3$ must be cubic, but (Mshumi, 2014) argue that it is orthorhombic, and in fact the $L1_3$ structure.
- (Smithells, 1955) gave this structure the $L1_a$ designation as part of his extension of the original *Strukturbericht* labels. He does note that an alternative orthorhombic structure had been proposed.
- (Smithells, 1955) assigns this structure to space group $F432$ #209, but the positions given by (Tang, 1951) are also consistent with $Fm\bar{3}m$ #225, so we assign this structure to the higher symmetry space group.
- (Tang, 1951) does not give the lattice constant, so we use the value estimated by (Smithells, 1955).
- The Wyckoff positions are identical to those of the Ca_7Ge structure.

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{y}} + \frac{1}{2}\,a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,a\,\hat{\mathbf{y}}$$

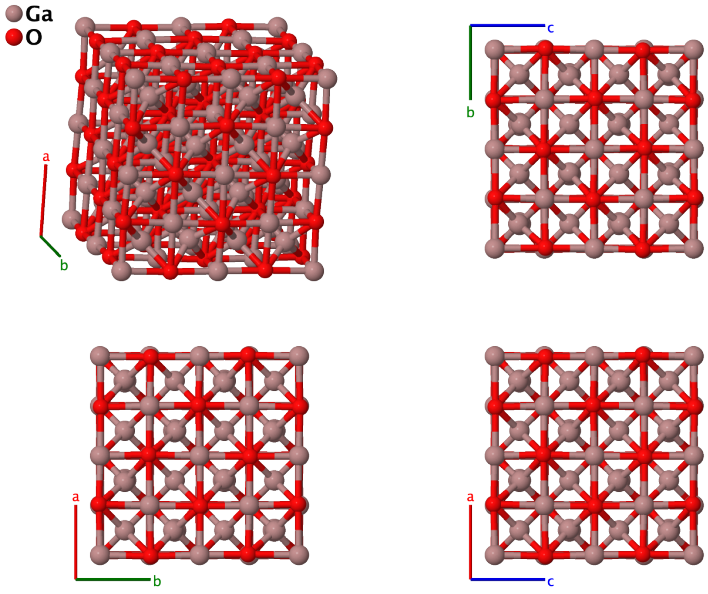
γ-Ga_2O_3 Structure: A11B4_cF120_227_acdf_e

http://aflow.org/prototype-encyclopedia/A11B4_cF120_227_acdf_e



Prototype	:	Ga_2O_3
AFLOW prototype label	:	A11B4_cF120_227_acdf_e
***Strukturbericht* designation**	:	None
Pearson symbol	:	cF120
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A11B4_cF120_227_acdf_e --params=`a, x_4, x_5

- Ga_2O_3 takes on a variety of structures:
  - α-Ga_2O_3, which has the corundum ($D5_1$) structure,
  - β-Ga_2O_3,
  - γ-Ga_2O_3, this structure, and
  - ϵ-Ga_2O_3, a structure with many vacancies which can be approximated by the κ-alumina structure.

  Note that all of the gallium sites are only partially occupied.

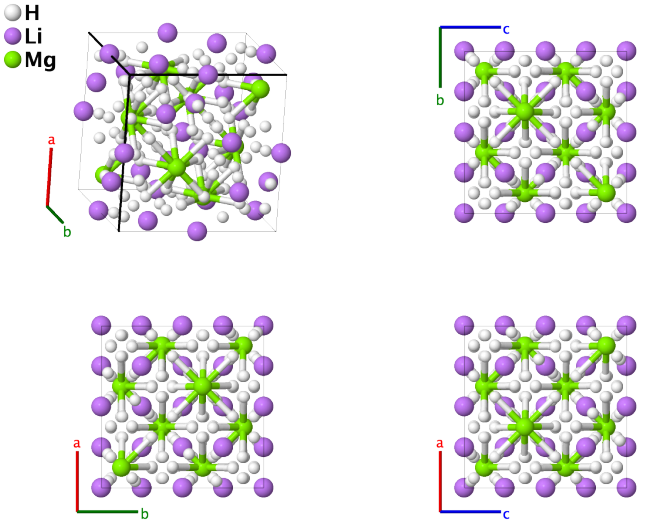
Predicted Li_2MgH_{16} High-Temperature Superconductor (250 GPa) Structure: A16B2C_cF152_227_eg_d_a

http://aflow.org/prototype-encyclopedia/A16B2C_cF152_227_eg_d_a



Prototype	:	$H_{16}Li_2Mg$
AFLOW prototype label	:	A16B2C_cF152_227_eg_d_a
***Strukturbericht* designation**	:	None
Pearson symbol	:	cF152
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A16B2C_cF152_227_eg_d_a --params=`a, x_3, x_4, z_4

- This structure was predicted by (Sun, 2019) as a metastable state of Li_2MgH_{16} at 250 GPa and $T = 0$ K. If it is possible to construct this compound, or if it becomes stable due to thermodynamic considerations, it is predicted to have a superconducting transition T_c between 430 and 473 K.
- The predicted $T = 0$ K ground state at 300 GPa is a $P\bar{3}m1$ #164 structure with molecular hydrogen.
- (Sun, 2019) give the Wyckoff positions in setting 1 of space group $Fd\bar{3}m$ #227. (They list the Wyckoff positions of the magnesium and lithium atoms as (8*b*) and (16*c*), respectively. They are actually at (8*a*) and (16*d*), as in their 300 GPa data.) We used FINDSYM to shift this to our standard setting 2.

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}}$$

Other compounds with this structure

- $LaCr_2Al_{20}$, $CeCr_2Al_{20}$, $PrCr_2Al_{20}$, $SmCr_2Al_{20}$, $YbCr_2Al_{20}$, $CeTi_2Al_{20}$, $PrTi_2Al_{20}$, $SmTi_2Al_{20}$, $YbTi_2Al_{20}$, CeV_2Al_{20}, GdV_2Al_{20}, LaV_2Al_{20}, PrV_2Al_{20}, SmV_2Al_{20}, $CeNi_2Cd_{20}$, $GdNi_2Cd_{20}$, $LaNi_2Cd_{20}$, $NdNi_2Cd_{20}$, $PrNi_2Cd_{20}$, $SmNi_2Cd_{20}$, YNi_2Cd_{20}, $CePd_2Cd_{20}$, $PrPd_2Cd_{20}$, $SmPd_2Cd_{20}$, and UOs_2Zn_{20}

- (Samson, 1958) gives the atomic coordinates in terms of setting 1 of space group $Fd\bar{3}m$ #227. We have shifted this to the standard setting 2, where the inversion site of the lattice is at the origin.
- If the (8*a*), (16*c*) and (16*d*) sites are occupied by the same type of atom this becomes the $Zn_{22}Zr$ structure.
- In the ternary compounds $LnMX_{20}$, the rare earth (*Ln*) metal occupies the (8*a*) site, the transition metal (*M*) the (16*d*) site, and *X*=Al,Cd,Zn occupies the (16*c*), (48*f*) and (96*g*) sites. These compounds are sometimes listed under the $CeCr_2Al_{20}$ prototype.

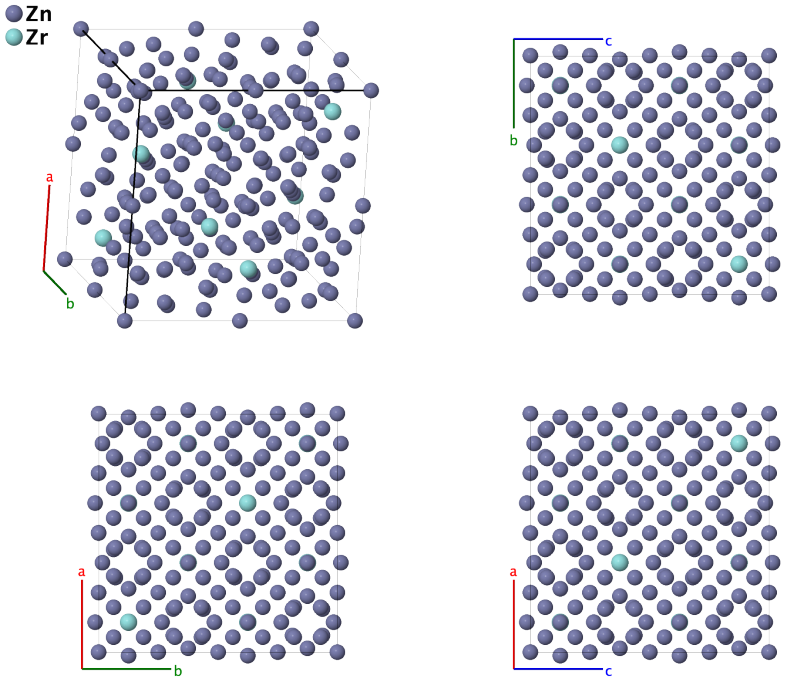
$Zn_{22}Zr$ Structure: A22B_cF184_227_cdfg_a

http://aflow.org/prototype-encyclopedia/A22B_cF184_227_cdfg_a



Prototype	:	$Zn_{22}Zr$
AFLOW prototype label	:	A22B_cF184_227_cdfg_a
***Strukturbericht* designation**	:	None
Pearson symbol	:	cF184
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A22B_cF184_227_cdfg_a --params=`a, x_4, x_5, z_5

Other compounds with this structure

- $Be_{22}Mo$ and $Be_{22}W$

- (Samson, 1961) gives the atomic coordinates in terms of setting 1 of space group $F\bar{3}m$ #227. We have shifted this to the standard setting 2, where the inversion site of the lattice is at the origin.
- Samson also suggests that the "$Zn_{14}Zr$" structure is created when zirconium atoms replace some of the zinc atoms on the (16*c*) site [the (16*d*) site in Samson's orientation].
- This structure can be derived from the $Mg_3Cr_2Al_{18}$ structure.

Face-centered Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}}\end{aligned}$$

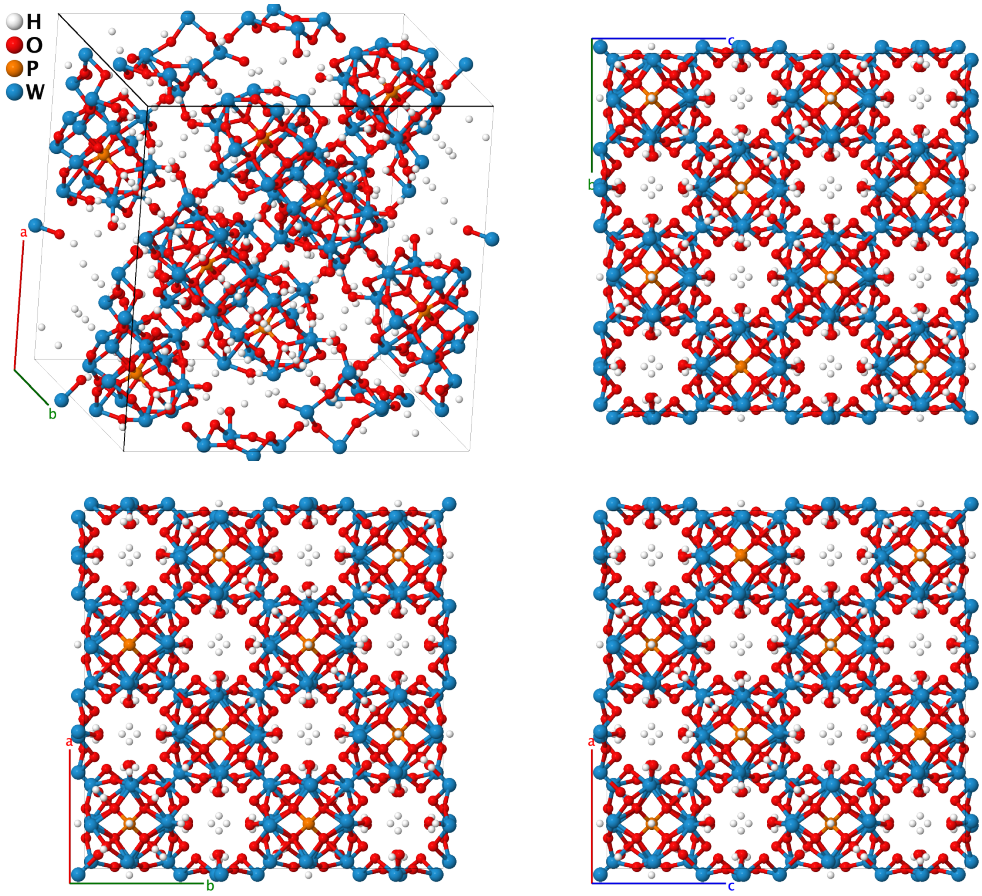
$H_3PW_{12}O_{40}\cdot 29H_2O$ ($H4_{21}$) Structure: A29B40CD12_cF656_227_ae2fg_e3g_b_g

http://aflow.org/prototype-encyclopedia/A29B40CD12_cF656_227_ae2fg_e3g_b_g



Prototype	:	$(H_2O)_{29}O_{40}PW_{12}$
AFLOW prototype label	:	A29B40CD12_cF656_227_ae2fg_e3g_b_g
***Strukturbericht* designation**	:	$H4_{21}$
Pearson symbol	:	cF656
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A29B40CD12_cF656_227_ae2fg_e3g_b_g --params=`$a, x_3, x_4, x_5, x_6, x_7, z_7, x_8, z_8, x_9, z_9, x_{10}, z_{10}, x_{11}, z_{11}$

Other compounds with this structure

- $H_3PMo_{12}O_{40}\cdot 30H_2O$

- This compound is often colloquially called "PWA-29." On heating some water molecules will disassociate, leaving $H_3PW_{12}O_{40}\cdot 6H_2O$, $H_3PW_{12}O_{40}\cdot 5H_2O$ ($H4_{16}$), or $H_3PW_{12}O_{40}\cdot 3H_2O$.
- The three hydrogen atoms not formally associated with the water molecules are not located. Presumably they join with some water molecules to form H_3O^+ ions.

- Even the exact number and position of the water molecules is uncertain. (Clark, 1976), studying the related compound $H_3PMo_{12}O_{40}{\cdot}30H_2O$, states the the composition is approximately $30H_2O$, and that "only six of the water molecules occupy ordered sites."

Face-centered Cubic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}}\end{aligned}$$

Prototype	:	$C_2ClMgNa_3O_6$
AFLOW prototype label	:	A2BCD3E6_cF208_227_e_c_d_f_g
***Strukturbericht* designation**	:	$G7_3$
Pearson symbol	:	cF208
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A2BCD3E6_cF208_227_e_c_d_f_g --params=`a, x_3, x_4, x_5, z_5

- This is the original structure determined by (Shiba, 1931) and given the designation $G7_3$ in (Hermann, 1937). (Negro, 1975) showed that the correct structure was actually related to cubic pyrochlore, however the two structures are very similar, and a displacement of the oxygen atoms by less than 1 Å brings the two structures into agreement.

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}}$$

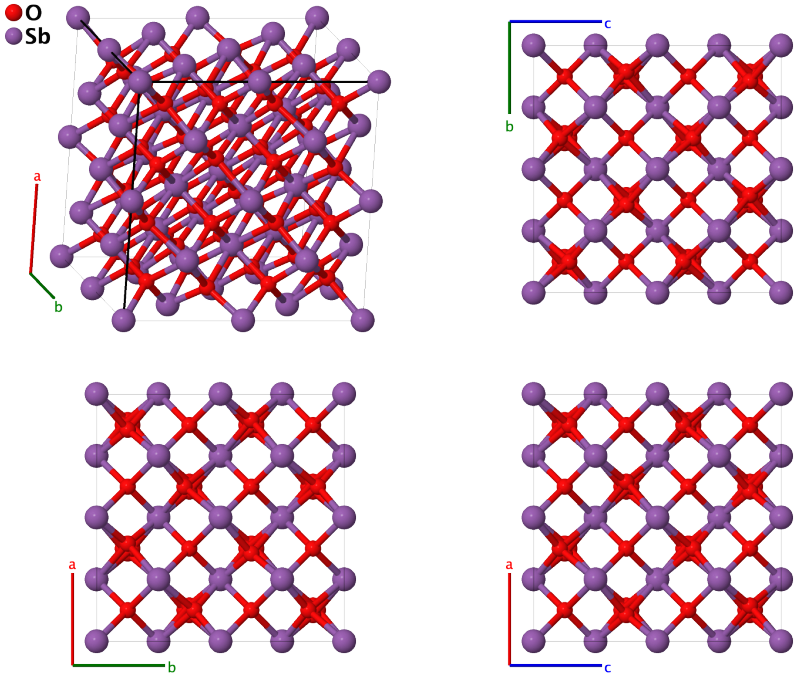
$D6_2$ (Sb_2O_4) (*obsolete*) Structure: A2B_cF96_227_abf_cd

http://aflow.org/prototype-encyclopedia/A2B_cF96_227_abf_cd



Prototype	:	O_2Sb
AFLOW prototype label	:	A2B_cF96_227_abf_cd
***Strukturbericht* designation**	:	$D6_2$
Pearson symbol	:	cF96
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A2B_cF96_227_abf_cd --params=`a, x_5

- Shortly after (Gottfried, 1937) gave this compound the *Strukturbericht* designation $D6_2$, (Dihiström, 1937) showed that they were actually determining the structure of Sb_3O_6OH, making this structure obsolete. Indeed, (Herrman, 1943) formally withdraws this from the *Strukturbericht* list, saying "The type and description [in (Gottfried, 1937)] should be deleted, as the x-rays were not based on the supposed substance." We present it for its historical interest.
- Modern experiments have determined that SbO_2 appears as cervantite (α-Sb_2O_4) or clinocervantite (β-Sb_2O_4).

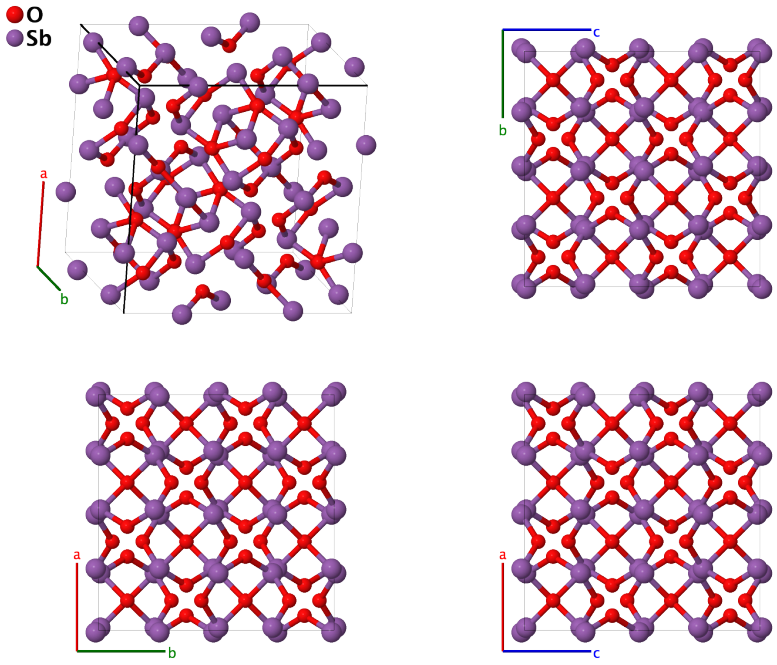
Senarmontite (Sb_2O_3, $D6_1$) Structure: A3B2_cF80_227_f_e

http://aflow.org/prototype-encyclopedia/A3B2_cF80_227_f_e



Prototype	:	O_3Sb_2
AFLOW prototype label	:	A3B2_cF80_227_f_e
***Strukturbericht* designation**	:	$D6_1$
Pearson symbol	:	cF80
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A3B2_cF80_227_f_e --params=`a, x_1, x_2

Other compounds with this structure

- As_2O_3 (arsenolite)

- (Ewald, 1931) designated this as *Strukturbericht* $D6_1$, however (Parthé, 1993) and (Villars, 1991) label this as *Strukturbericht* $D5_4$, and Parthé uses As_2O_3 as the prototype. While this structure obviously fits better with the $D5$ series (A_2B_3) than $D6$ (A_2B_4), the $D5_4$ structure was (inadvertently?) omitted from (Hermann, 1937), which jumps from $D5_3$ to $D5_5$. We will follow this historical record (Ewald, 1931) here.
- This is the cubic form of Sb_2O_3. For the orthorhombic form see the valentinite ($D5_{11}$) structure.
- (Svensson, 1975) gave the atomic coordinates in setting 1 of space group $Fd\bar{3}m$ #227. We used FINDSYM to shift the coordinates to the standard setting 2.

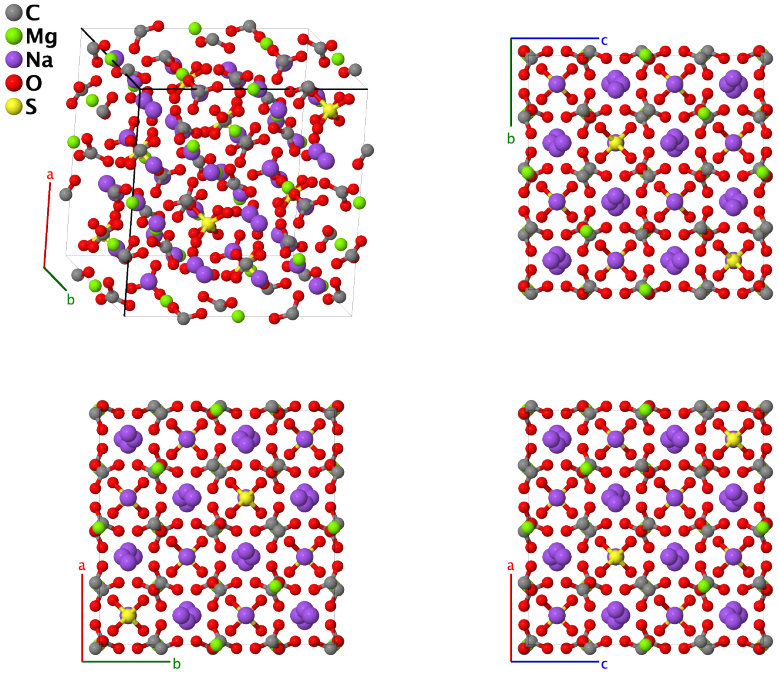
$H5_6$ [Tychite, $Na_6Mg_2SO_4(CO_3)_4$)] (*obsolete*) Structure: A4B2C6D16E_cF232_227_e_d_f_eg_a

http://aflow.org/prototype-encyclopedia/A4B2C6D16E_cF232_227_e_d_f_eg_a



Prototype	:	$C_4Mg_2Na_6O_{16}S$
AFLOW prototype label	:	A4B2C6D16E_cF232_227_e_d_f_eg_a
***Strukturbericht* designation**	:	$H5_6$
Pearson symbol	:	cF232
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A4B2C6D16E_cF232_227_e_d_f_eg_a --params=`$a, x_3, x_4, x_5, x_6, z_6$

- This is the original structure determined by (Shiba, 1931) and given the designation $H5_6$ in (Hermann, 1937). (Schmidt, 2006) showed that the true structure is in space group $Fd\bar{3}$ #203, however the two structures are very similar, and a displacement of the oxygen atoms by less than 1 Å brings the two structures into agreement.
- (Hermann, 1937) gives the chemical formula as $Na_6Mg_2SO_4(CO_3)_2$, but the given Wyckoff positions are in agreement with the correct formula, $Na_6Mg_2SO_4(CO_3)_4$.

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{y}} + \frac{1}{2}\,a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}\,a\,\hat{\mathbf{x}} + \frac{1}{2}\,a\,\hat{\mathbf{y}}$$

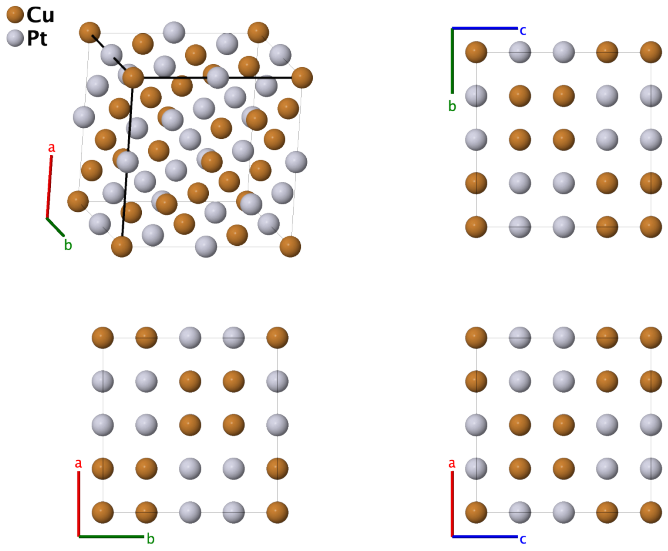
Cubic CuPt ($L1_3$ (I), $D4$) Structure: AB_cF32_227_c_d

http://aflow.org/prototype-encyclopedia/AB_cF32_227_c_d



Prototype	:	CuPt
AFLOW prototype label	:	AB_cF32_227_c_d
***Strukturbericht* designation**	:	$L1_3$ (I)
Pearson symbol	:	cF32
Space group number	:	227
Space group symbol	:	$Fd\bar{3}m$
AFLOW prototype command	:	`aflow --proto=AB_cF32_227_c_d --params=`a

- (Johansson, 1929) described two possible structures for CuPt. (Ewald, 1929) and later (Villars, 2007) used the description to determine the space group and atomic positions. This page describes the cubic structure, which (Ewald, 1929) labeled *Strukturbericht* $L1_1$. The other structure is rhombohedral, and was listed as $L1_1$. (Villars, 2007) prefers the later structure, listing the current one as "superceded."
- (Barrett, 1980) noted that even slight additions of platinum above stoichiometry will cause a change in the crystal structure.
- This structure is equivalent to the $D4$ structure of (Lu, 1991).
- This structure should not be confused with the $CuPt_3$ structure, which has also been given the $L1_3$ label, and which we will often refer to as $L1_3$ (II).

Face-centered Cubic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}}$$

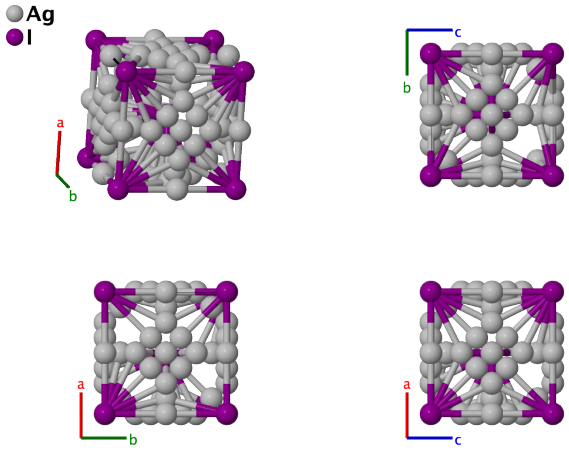
α-AgI ($B23$) Structure: A21B_cI44_229_bdh_a

http://aflow.org/prototype-encyclopedia/A21B_cI44_229_bdh_a



Prototype	:	AgI
AFLOW prototype label	:	A21B_cI44_229_bdh_a
***Strukturbericht* designation**	:	$B23$
Pearson symbol	:	cI44
Space group number	:	229
Space group symbol	:	$Im\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A21B_cI44_229_bdh_a --params=`a, y_4

- Under ambient conditions, silver iodide exists as a mixture of β-AgI, which has the wurtzite ($B4$) structure, and γ-AgI, which has the zincblende ($B3$) structure (Hull, 2004). Above 420 K, AgI transforms to this superionic α phase. The iodine atom sits at the ($2a$) site of the bcc lattice of space group #229, while the silver atom is randomly distributed on one of the ($6b$), ($12d$), and ($24h$) Wyckoff sites in each unit cell. On average, then, each of the 21 Ag sites listed above is occupied only 4.762% of the time in any given primitive cell. This easy transport between sites drives the superionic behavior of α-AgI.

Body-centered Cubic primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}a\,\hat{\mathbf{z}}$$

- The original determination of this structure by (Brandenberger, 1933) did not locate the hydrogen atoms, and according to (Gottfried, 1937) used the coordinates of garnet, $S1_4$. (Bartl, 1986) was able to locate the hydrogen atoms, and as they do not change the space group we include them in the $J2_3$ structure.
