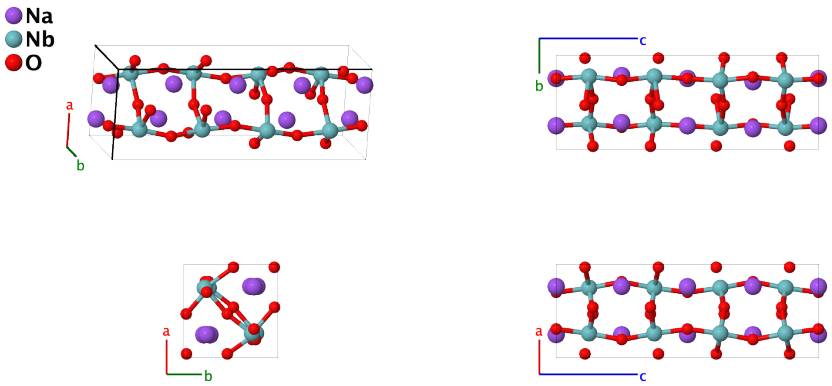
Lueshite ($NaNbO_3$) Structure: ABC3_oP40_57_cd_e_cd2e

http://aflow.org/prototype-encyclopedia/ABC3_oP40_57_cd_e_cd2e



Prototype	:	$NaNbO_3$
AFLOW prototype label	:	ABC3_oP40_57_cd_e_cd2e
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP40
Space group number	:	57
Space group symbol	:	*Pbcm*
AFLOW prototype command	:	`aflow --proto=ABC3_oP40_57_cd_e_cd2e --params=`$a, b/a, c/a, x_1, x_2, x_3, y_3, x_4, y_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7$

Other compounds with this structure

- $NaNb_{1-x}Ti_xO_3$

- If the AFLOW parameters are set to `--params=`$a, 1, \sqrt{8}, 1/4, 3/4, 1/4, 1/4, 1/4, 3/4, 1/4, 3/4, 5/8, 1/2, 1/2, 5/8, 0, 0, 5/8$ then the structure is equivalent to Cubic Perovskite $E2_1$.

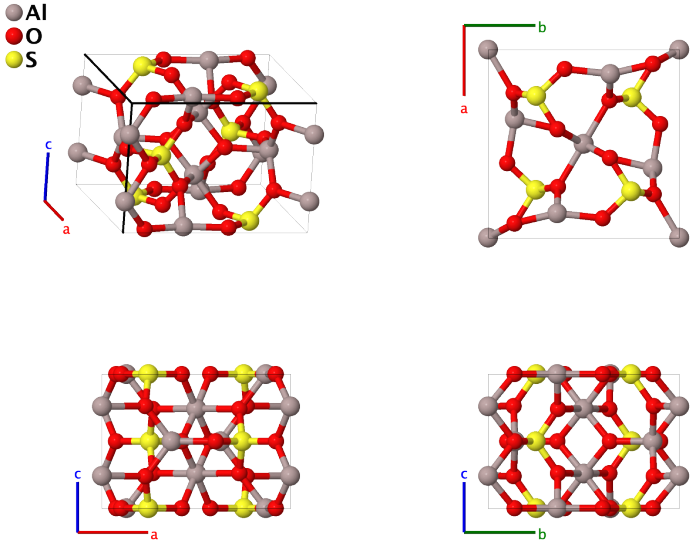
Andalusite (Al_2SiO_5, $S0_2$) Structure: A2B5C_oP32_58_eg_3gh_g

http://aflow.org/prototype-encyclopedia/A2B5C_oP32_58_eg_3gh_g



Prototype	:	Al_2O_5Si
AFLOW prototype label	:	A2B5C_oP32_58_eg_3gh_g
***Strukturbericht* designation**	:	$S0_2$
Pearson symbol	:	oP32
Space group number	:	58
Space group symbol	:	*Pnnm*
AFLOW prototype command	:	`aflow --proto=A2B5C_oP32_58_eg_3gh_g --params=`$a, b/a, c/a, z_1, x_2, y_2, x_3, y_3, x_4, y_4, x_5, y_5, x_6, y_6, x_7, y_7, z_7$

- Three crystal polymorphs of Al_2SiO_5 have been characterized: kyanite ($S0_1$), space group $P\bar{1}$ #2, andalusite ($S0_2$), space group *Pnnm* #58, and sillimanite ($S0_3$), space group *Pnma* #62. All are characterized chains of edge-sharing SiO_6 tetrahedra and Al octahedra.
- We use the ambient pressure data of (Yang, 1997).
- (Hermann, 1937) listed this as $S0_2$, but also gave it the $H5_3$ designation in the index.

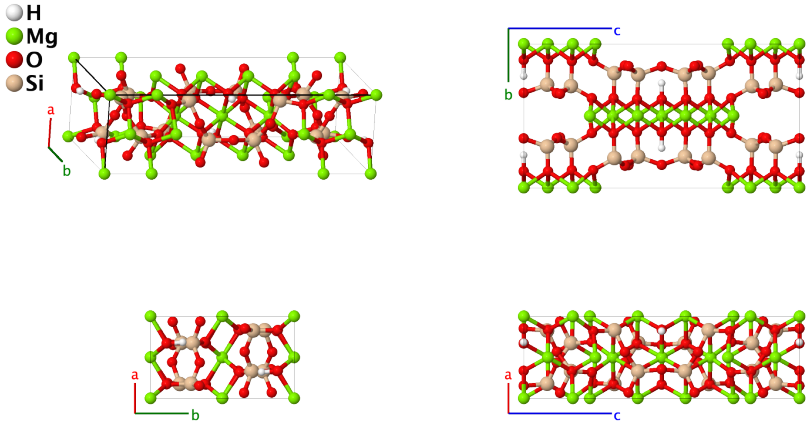
Protoanthophyllite ($H_2Mg_7Si_8O_{24}$) Structure: A2B7C24D8_oP82_58_g_ae2f_2g5h_2h

http://aflow.org/prototype-encyclopedia/A2B7C24D8_oP82_58_g_ae2f_2g5h_2h



Prototype	:	$H_2Mg_7O_{24}Si_8$
AFLOW prototype label	:	A2B7C24D8_oP82_58_g_ae2f_2g5h_2h
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP82
Space group number	:	58
Space group symbol	:	*Pnnm*
AFLOW prototype command	:	`aflow --proto=A2B7C24D8_oP82_58_g_ae2f_2g5h_2h --params=`$a, b/a, c/a, z_2, z_3, z_4, x_5, y_5, x_6, y_6, x_7, y_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}$

- This structure is approximately one-half of the unit cell of anthophyllite ($S\,4_4$).
- Like anthophyllite, iron is sometimes mixed with magnesium. For this sample, (Konishi, 2003) found that the Mg-I ($2a$) site contains 2.5% iron, Mg-III ($4f$) contains 2.1%, and Mg-IV ($4f$) contains 27.7% iron.
- (Konishi, 2003) give the crystal structure in the *Pmnn* setting of space group #58. We used FINDSYM to transform this to the standard *Pnnm* orientation.

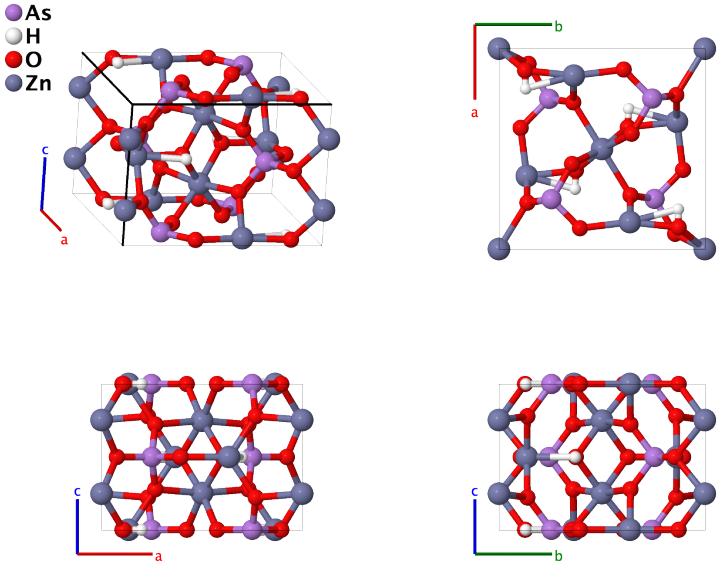
Adamite [$Zn_2(AsO_4)(OH)$, $H2_7$] Structure: ABC5D2_oP36_58_g_g_3gh_eg

http://aflow.org/prototype-encyclopedia/ABC5D2_oP36_58_g_g_3gh_eg



Prototype	:	$AsHO_5Zn_2$
AFLOW prototype label	:	ABC5D2_oP36_58_g_g_3gh_eg
***Strukturbericht* designation**	:	$H2_7$
Pearson symbol	:	oP36
Space group number	:	58
Space group symbol	:	*Pnnm*
AFLOW prototype command	:	`aflow --proto=ABC5D2_oP36_58_g_g_3gh_eg --params=`$a, b/a, c/a, z_1, x_2, y_2, x_3, y_3, x_4, y_4, x_5, y_5, x_6, y_6, x_7, y_7, x_8, y_8, z_8$

Other compounds with this structure

- $Cu_2(AsO_4)(OH)$ and $Cu_2(PO_4)(OH)$

- This structure was originally determined by (Kokkoros, 1937) and designated $H2_7$ by (Gottfried, 1940). (Hill, 1976) refined the structure, including the positions of the hydrogen atoms in the OH radical.

Space group number	:	59
Space group symbol	:	*Pmmn*
AFLOW prototype command	:	`aflow --proto=A4B2C3_oP18_59_ef_ab_af --params=`$a, b/a, c/a, z_1, z_2, z_3, y_4, z_4, x_5, z_5, x_6, z_6$

- Ammonium Nitrate exists in a variety of forms, (Hermann, 1937) depending on the temperature:

Phase	Temperature °C	*Strukturbericht*	Page	
I	125 – 170	$G0_8$	AB_cP2_221_a_b.NH4.NO3	
II	84 – 125	$G0_9$	ABC3_tP10_100_b_a_bc	
III	32 – 84	$G0_{10}$	ABC3_oP20_62_c_c_cd.N.NH4.O	
IV	-17 – 32	$G0_{11}$	A4B2C3_oP18_59_ef_ab_af	(this structure)
V	< -17	Gwihabaite	A4B2C3_tP72_77_8d_ab2c2d_6d2	

- In the original reference (West, 1932) did not determine the positions of the hydrogen atoms. Since the hydrogen atoms are in the same space group, we continue to designate this the $G0_{11}$ structure.

- An earlier version of this structure found by (Ketelaar, 1936) was given the $D8_7$ *Strukturbericht* designation in (Gottfried, 1938). It was later realized that this structure had a rather unexpected arrangement of vanadium atoms, and the structure was revised by (Enjalbert, 1986) and others.

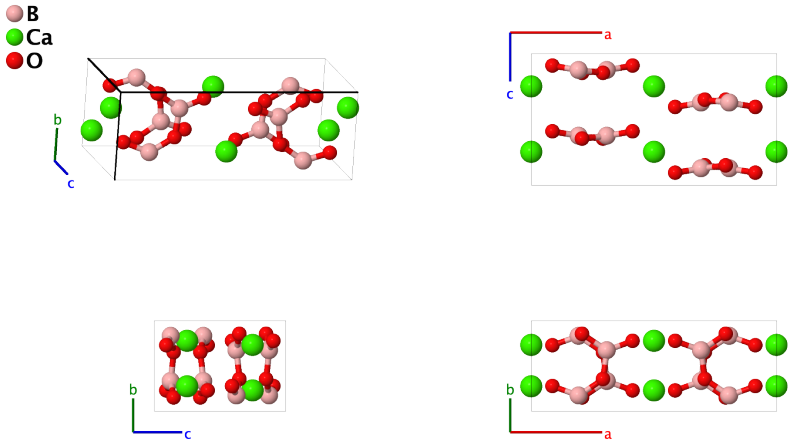
CaB_2O_4 I ($E3_2$) Structure: A2BC4_oP28_60_d_c_2d

http://aflow.org/prototype-encyclopedia/A2BC4_oP28_60_d_c_2d



Prototype	:	B_2CaO_4
AFLOW prototype label	:	A2BC4_oP28_60_d_c_2d
***Strukturbericht* designation**	:	$E3_2$
Pearson symbol	:	oP28
Space group number	:	60
Space group symbol	:	*Pbcn*
AFLOW prototype command	:	`aflow --proto=A2BC4_oP28_60_d_c_2d --params=`$a, b/a, c/a, y_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4$

- CaB_2O_4 exists in at least four phases (Marezio, 1969):
- I - The ground state, stable below 1.2 GPa, *Strukturbericht* $E3_2$ (this structure).
- II – Orthorhombic high pressure structure, stable between 1.2 and 1.5 GPa, presumably calciborite.
- III – Orthorhombic high pressure structure, stable between 1.5 and 2.5 GPa.
- IV – Cubic high pressure structure, stable between 2.5 and 4.0 GPa.
- (Marezio, 1963) gives the crystal structure in the *Pnca* setting of space group #60. We have used FINDSYM to transform this to the standard *Pbcn* setting.

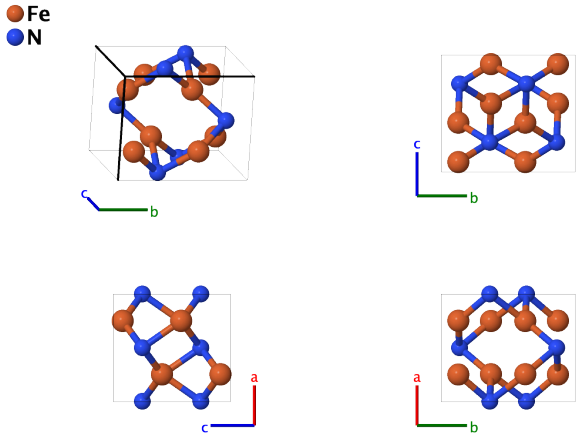
ζ-Fe_2N Structure: A2B_oP12_60_d_c

http://aflow.org/prototype-encyclopedia/A2B_oP12_60_d_c.Fe2N

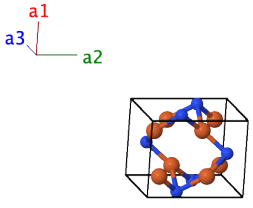


Prototype	:	Fe_2N
AFLOW prototype label	:	A2B_oP12_60_d_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP12
Space group number	:	60
Space group symbol	:	*Pbcn*
AFLOW prototype command	:	`aflow --proto=A2B_oP12_60_d_c --params=`$a, b/a, c/a, y_1, x_2, y_2, z_2$

- This structure has the same AFLOW label as α-PbO_2, but in that case the lead site is only 49% occupied, so the composition is actually closer to PbO_4.
- The structures are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

Other compounds with this structure

- $Ca_{2-x}Sr_xRuO_4$

- (Friedt, 2001) never give the positions of the ruthenium atoms in this structure, however the composition of the crystal dictates that they can only be at the (4*a*) or (4*b*) Wyckoff positions, and the Ru-O distances given are consistent with the (4*a*) site.
- The authors identify a low temperature "$S-Pbca$" phase and a high temperature "$L-Pbca$" phase, with a phase transition in the range 350-400 K. The major difference between the two phases is a 4% elongation of the c axis in the $L-Pbca$ phase, accompanied by a 4.5% contraction along the b axis, with the a axis being substantially unchanged. There is also a substantial change in the tilt of the oxygen octahedra surrounding the Ru atoms. Here we show the crystal in the $S-Pbca$ phase using data taken at 180 K.
- (Bertinshaw, 2019) identify S^* and L^* phases that have the same symmetry but stabilized by the application of an electric current.

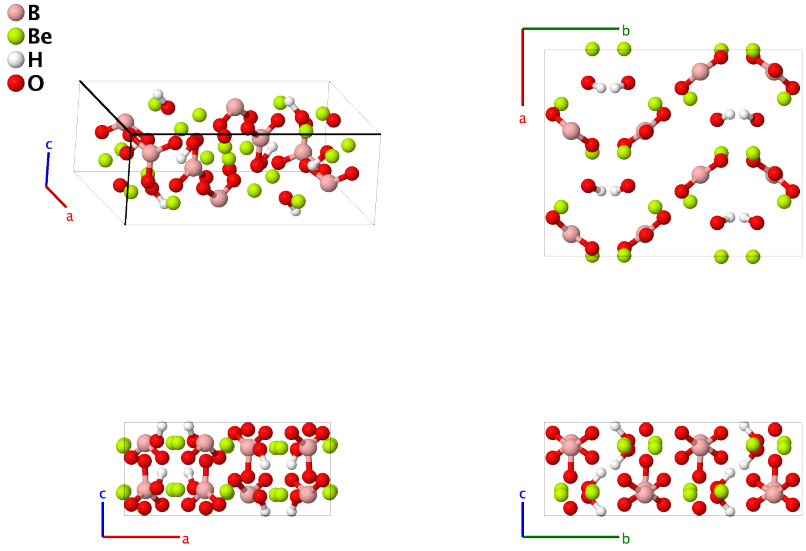
Hambergite [$Be_2BO_3(OH)$, $G7_2$] Structure: AB2CD4_oP64_61_c_2c_c_4c

http://aflow.org/prototype-encyclopedia/AB2CD4_oP64_61_c_2c_c_4c

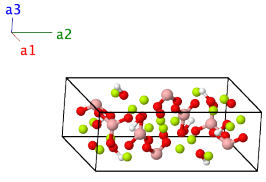


Prototype	:	BBe_2HO_4
AFLOW prototype label	:	AB2CD4_oP64_61_c_2c_c_4c
***Strukturbericht* designation**	:	$G7_2$
Pearson symbol	:	oP64
Space group number	:	61
Space group symbol	:	*Pbca*
AFLOW prototype command	:	`aflow --proto=AB2CD4_oP64_61_c_2c_c_4c --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- The original description of this structure in (Hermann, 1937) did not include the positions of the hydrogen atoms, instead using OH for the O(IV)-H radical.
- The sample actually measured by (Gatta, 2012) has 4% of the OH radicals replaced by fluorine.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type

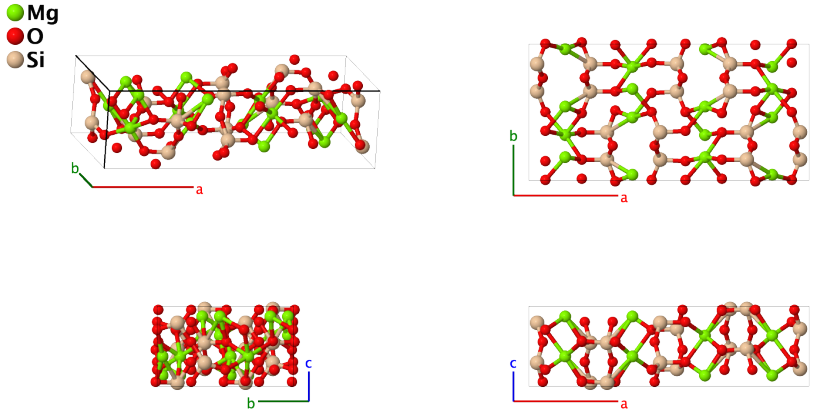
Enstatite ($MgSiO_3$, $S4_3$) Structure: AB3C_oP80_61_2c_6c_2c

http://aflow.org/prototype-encyclopedia/AB3C_oP80_61_2c_6c_2c



Prototype	:	MgO_3Si
AFLOW prototype label	:	AB3C_oP80_61_2c_6c_2c
***Strukturbericht* designation**	:	$S4_3$
Pearson symbol	:	oP80
Space group number	:	61
Space group symbol	:	*Pbca*
AFLOW prototype command	:	`aflow --proto=AB3C_oP80_61_2c_6c_2c --params=`$a, b/a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}$

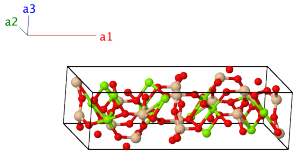
Other compounds with this structure

- $FeSiO_3$ (ferrosilite) and $CoSiO_3$ (Co-pyroxene)

- Enstatite (or properly orthoenstatite) is an end point of orthopyroxene, $XYSi_2O_6$, where X and Y are small-radius divalent cations. If either X or Y is replaced by a transition metal the system becomes a monoclinic clinopyroxene, in space group $C2/c$ #15.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$x_1\,\mathbf{a}_1 + y_1\,\mathbf{a}_2 + z_1\,\mathbf{a}_3$	=	$x_1 a\,\hat{\mathbf{x}} + y_1 b\,\hat{\mathbf{y}} + z_1 c\,\hat{\mathbf{z}}$	($8c$)	Mg I

- (Groth, 1962) are not confident about the atomic positions, saying that "The computed values for the oxalyl chloride molecule . . . [are probably] less reliable than those listed for the bromide molecule [COBr]." In fact, we have not been able to reconcile their crystal structure for COBr with the distances between the atoms, so we have left that structure out of the encyclopedia at this time.

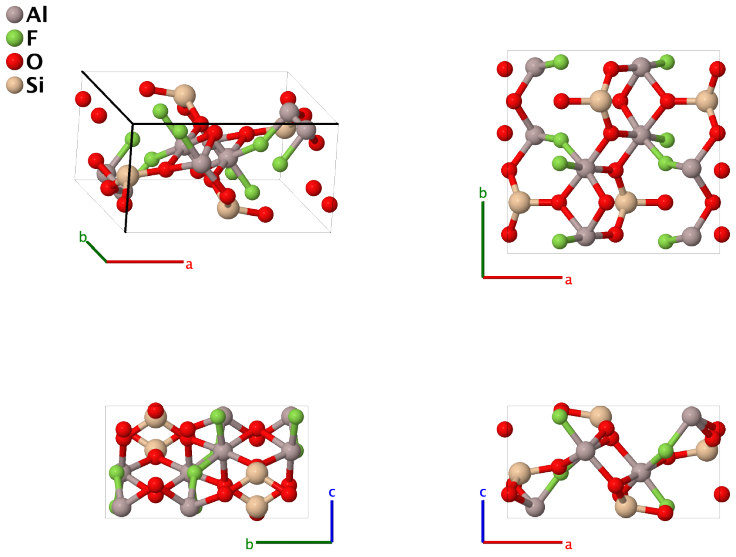
Topaz ($Al_2SiO_4F_2$, $S0_5$) Structure: A2B2C4D_oP36_62_d_d_2cd_c

http://aflow.org/prototype-encyclopedia/A2B2C4D_oP36_62_d_d_2cd_c



Prototype	:	$Al_2F_2O_4Si$
AFLOW prototype label	:	A2B2C4D_oP36_62_d_d_2cd_c
***Strukturbericht* designation**	:	$S0_5$
Pearson symbol	:	oP36
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A2B2C4D_oP36_62_d_d_2cd_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

Other compounds with this structure

- $Al_2SiO_4(F,OH)_2$

- The fluorine (8*d*) site in topaz can have a composition $F_{1-x}(OH)_x$, where $x < 0.3$.
- We use the data at $T = 298$ K from the "Pax08" sample in (Komatsu, 2003).
- The data was presented in the *Pbnm* setting of space group #62. We used FINDSYM to transform this into the standard *Pnma* setting.
- (Herman, 1937) gave this the $S0_5$ designation, but co-listed it as $H5_5$ in the index.

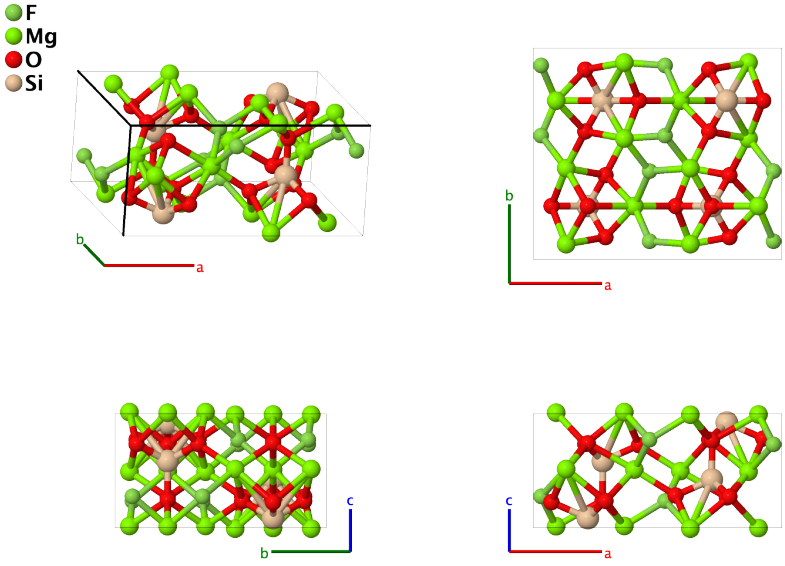
Norbergite [$Mg(F,OH)_2 \cdot Mg_2SiO_4$, $S0_7$] Structure: A2B3C4D_oP40_62_d_cd_2cd_c

http://aflow.org/prototype-encyclopedia/A2B3C4D_oP40_62_d_cd_2cd_c



Prototype	:	$F_2Mg_3O_4Si$
AFLOW prototype label	:	A2B3C4D_oP40_62_d_cd_2cd_c
***Strukturbericht* designation**	:	$S0_7$
Pearson symbol	:	oP40
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A2B3C4D_oP40_62_d_cd_2cd_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7$

- (Hermann, 1937) define *Strukturbericht* designation $S0_7$ as the general class of humite materials, $Mg(F,OH)_2 \cdot nMg_2SiO_4$. Their major reference for this is (Taylor, 1929), who gave structural data for the $n = 1$ structure, norbergite.
- We use the data from the fluorine-rich sample studied by (Gibbs, 1969), and assume that the (F, OH) site is pure fluorine. (Camara, 1997) studied OH-rich samples, and were able to locate the hydrogen atoms.
- (Gibbs, 1969) give the structure in the *Pbnm* setting of space group #62. We used FINDSYM to change this to the standard *Pnma* setting. This involves a rotation of the axis so that $\hat{x} \to \hat{z} \to \hat{y} \to \hat{x}$.

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

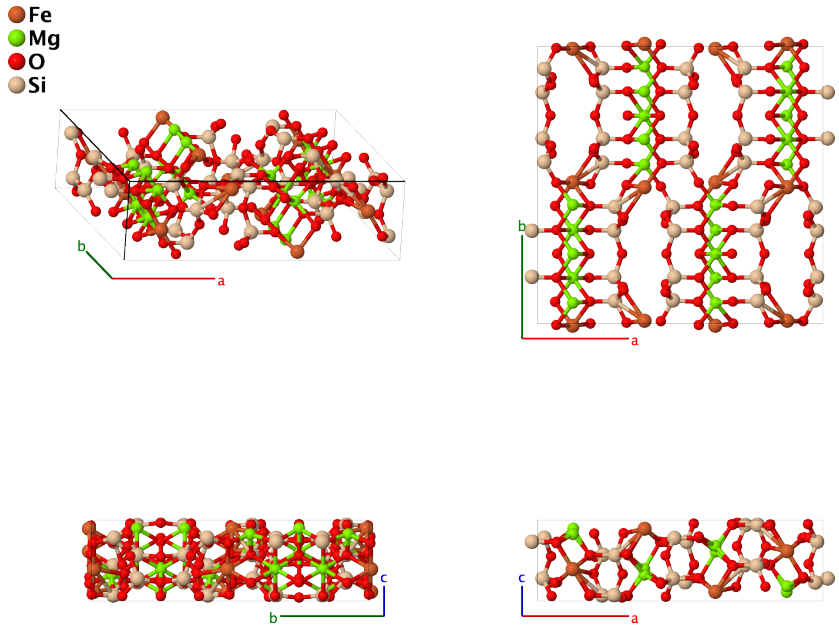
Anthophyllite ($Mg_5Fe_2Si_8O_{22}(OH)_2$, $S4_4$) Structure: A2B5C22D2E8_oP156_62_d_c2d_2c10d_2c_4d

http://aflow.org/prototype-encyclopedia/A2B5C22D2E8_oP156_62_d_c2d_2c10d_2c_4d



Prototype	:	$Fe_2Mg_5O_{22}(OH)_2Si_8$
AFLOW prototype label	:	A2B5C22D2E8_oP156_62_d_c2d_2c10d_2c_4d
***Strukturbericht* designation**	:	$S4_4$
Pearson symbol	:	oP156
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A2B5C22D2E8_oP156_62_d_c2d_2c10d_2c_4d --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}, x_{18}, y_{18}, z_{18}, x_{19}, y_{19}, z_{19}, x_{20}, y_{20}, z_{20}, x_{21}, y_{21}, z_{21}, x_{22}, y_{22}, z_{22}$

Other compounds with this structure

- $H_2Mg_7Si_8O_{24}$

- (Warren, 1930) analyzed their sample of anthophyllite under the assumption that it was free of iron, and this structure was given the $S4_4$ designation by (Hermann, 1937).
- (Walitzi, 1989) found a more accurate determination of the structure, but their sample included substantial amounts of iron. The Mg-I (4*c*) site is actually ($Mg_{0.99}Fe_{0.01}$), Mg-II (8*d*) is ($Mg_{0.98}Fe_{0.02}$), and Fe (8*d*) is ($Mg_{0.38}Fe_{0.62}$). Trace amounts of calcium, manganese and sodium were found on the magnesium/iron sites, and trace amounts of aluminum

were found on the silicon sites. Neither paper was able to determine the positions of the hydrogen atoms, which are included in the OH radicals.

- Anthophyllite can be thought of as an approximation to a doubled unit cell of protoanthophyllite, where the hydrogen atoms have been located.

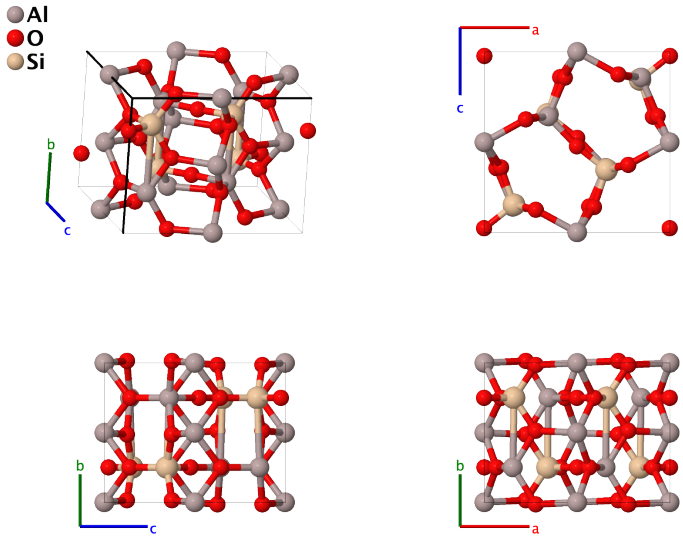
Sillimanite (Al_2SiO_5, $S0_3$) Structure: A2B5C_oP32_62_bc_3cd_c

http://aflow.org/prototype-encyclopedia/A2B5C_oP32_62_bc_3cd_c

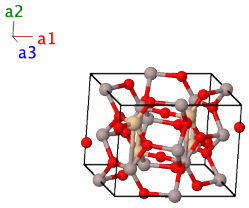


Prototype	:	Al_2O_5Si
AFLOW prototype label	:	A2B5C_oP32_62_bc_3cd_c
***Strukturbericht* designation**	:	$S0_3$
Pearson symbol	:	oP32
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A2B5C_oP32_62_bc_3cd_c --params=`$a, b/a, c/a, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, y_7, z_7$

- Three crystal polymorphs of Al_2SiO_5 have been characterized: kyanite ($S0_1$), space group $P\bar{1}$ #2, andalusite ($S0_2$), space group *Pnnm* #58, and sillimanite ($S0_3$), space group *Pnma* #62. All are characterized chains of edge-sharing SiO_6 tetrahedra and Al octahedra.
- We use the ambient pressure data of (Yang, 1997).
- (Yang, 1997) give the Wyckoff positions in the *Pbnm* setting of space group #62. We use FINDSYM to transform this to the standard *Pnma* setting. This involves a rotation of the principle axes and a shift of the set of aluminum atoms from the (4*a*) to the (4*b*) Wyckoff position.
- (Hermann, 1937) defined this as $S0_3$, but also listed it as $H5_2$ in the index.

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$



Basis vectors:

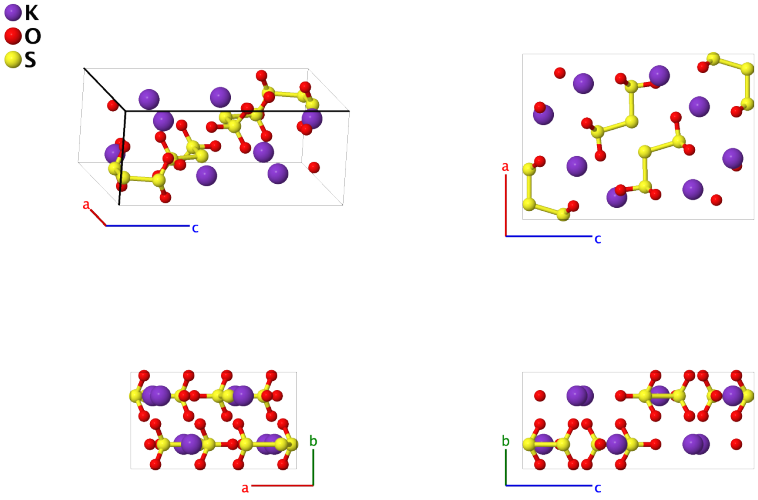
$K_2S_3O_6$ ($K5_1$) Structure: A2B6C3_oP44_62_2c_2c2d_3c

http://aflow.org/prototype-encyclopedia/A2B6C3_oP44_62_2c_2c2d_3c



Prototype	:	$K_2O_6S_3$
AFLOW prototype label	:	A2B6C3_oP44_62_2c_2c2d_3c
***Strukturbericht* designation**	:	$K5_1$
Pearson symbol	:	oP44
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A2B6C3_oP44_62_2c_2c2d_3c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9$

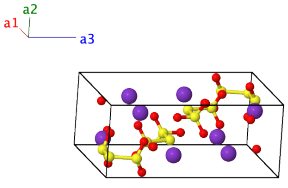
Other compounds with this structure

- $Rb_2S_3O_6$

- (Stewart, 1979) give the Wyckoff positions of this structure using the *Pnam* orientation of space group #62. We have used FINDSYM to change this to our standard *Pnma* orientation.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

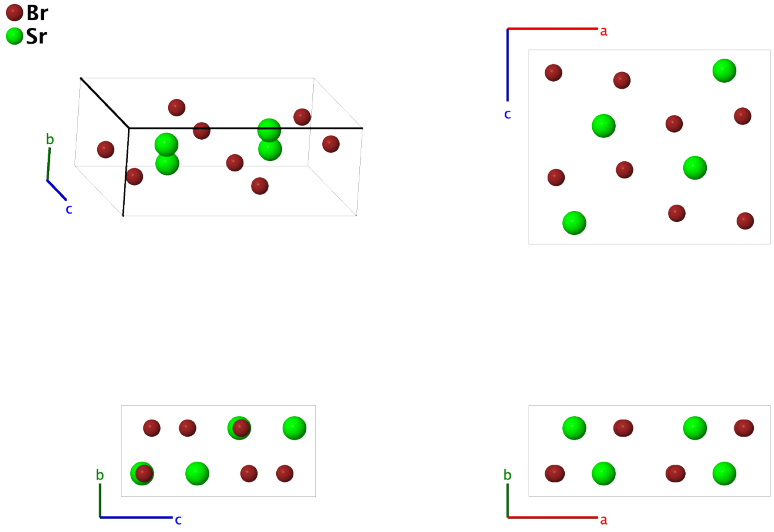
*C*53 ($SrBr_2$) (*obsolete*) Structure: A2B_oP12_62_2c_c

http://aflow.org/prototype-encyclopedia/A2B_oP12_62_2c_c.SrBr2



Prototype	:	Br_2Sr
AFLOW prototype label	:	A2B_oP12_62_2c_c
***Strukturbericht* designation**	:	*C*53
Pearson symbol	:	oP12
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A2B_oP12_62_2c_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3$

- (Kamermans, 1939) determined that $SrBr_2$ had a distorted $PbCl_2$ structure, and assigned it to space group *Pnma* #62. (Hermann, 1939) gave this the *Strukturbericht* designation *C*53.
- Some years later, (Sass, 1963) showed that this structure was incorrect, and that α-$SrBr_2$ was actually in space group $P4/n$ #85, rendering the *C*53 symbol obsolete. We include it here for historical interest.
- (Kamermans, 1939) gave the atomic positions in terms of the *Pbnm* setting of space group #62. We have used FINDSYM to translate this to the standard *Pnma* setting.
- Note that
  - $PbCl_2$ *C*23,
  - $HgCl_2$ *C*25,
  - SrH_2 *C*29,
  - Co_2Si *C*37, and
  - $SrBr_2$ *C*53

all have the same AFLOW prototype label. They are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.

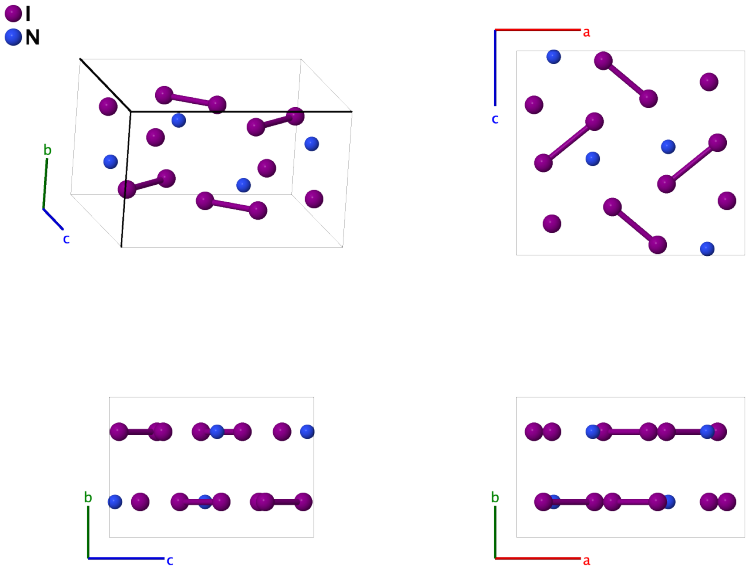
NH_4I_3 ($D0_{16}$) Structure: A3B_oP16_62_3c_c

http://aflow.org/prototype-encyclopedia/A3B_oP16_62_3c_c



Prototype	:	$I_3(NH_4)$
AFLOW prototype label	:	A3B_oP16_62_3c_c
***Strukturbericht* designation**	:	$D0_{16}$
Pearson symbol	:	oP16
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A3B_oP16_62_3c_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4$

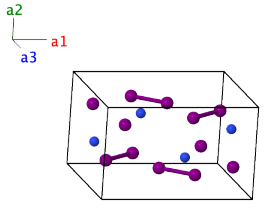
Other compounds with this structure

- CsI_3 and $CsBr_3$

- (Cheesman, 1970) gives the positions of the atoms in Cartesian coordinates, which we have translated into the standard Wyckoff notation.
- The hydrogen positions are not given, so the NH_4 molecules are centered on the ($4c$) Wyckoff position.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

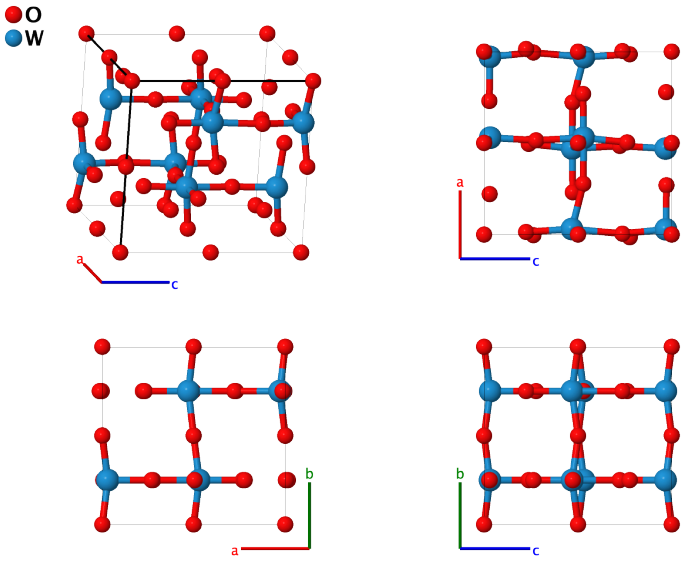
Original β-WO_3 (*obsolete*) Structure: A3B_oP32_62_ab4c_2c

http://aflow.org/prototype-encyclopedia/A3B_oP32_62_ab4c_2c



Prototype	:	O_3W
AFLOW prototype label	:	A3B_oP32_62_ab4c_2c
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP32
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A3B_oP32_62_ab4c_2c --params=`$a, b/a, c/a, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, z_7, x_8, z_8$

- All stable phases of WO_3 are distortions of the cubic α-ReO_3 ($D0_9$) phase. Based on (Woodward, 1997 and Vogt, 1999), the known stable phases and their approximate temperature ranges are:
  - α-WO_3 (1010-1170 K) (Vogt, 1999)
  - β-WO_3 (600-1170 K) (Vogt, 1999)
  - γ-WO_3 (290-600 K) (Vogt, 1999)
  - δ-WO_3 (230-290 K) (Diehl, 1978)
  - ϵ-WO_3 (below 23 K) (Woodward, 1997)

  Woodward's caption says "The transition temperatures display large hysteresis effects and universal agreement is not found in the literature."
- In addition, several other structures have been proposed and/or found:
  - The original $D0_{10}$ structure (Bräkken, 1931), (Hermann, 1937) superseded by δ-WO_3
  - Original β-WO_3 (Salje, 1977), this structure
  - Hexagonal WO_3 (Gerand, 1979) (metastable)

Simple Orthorhombic primitive vectors:

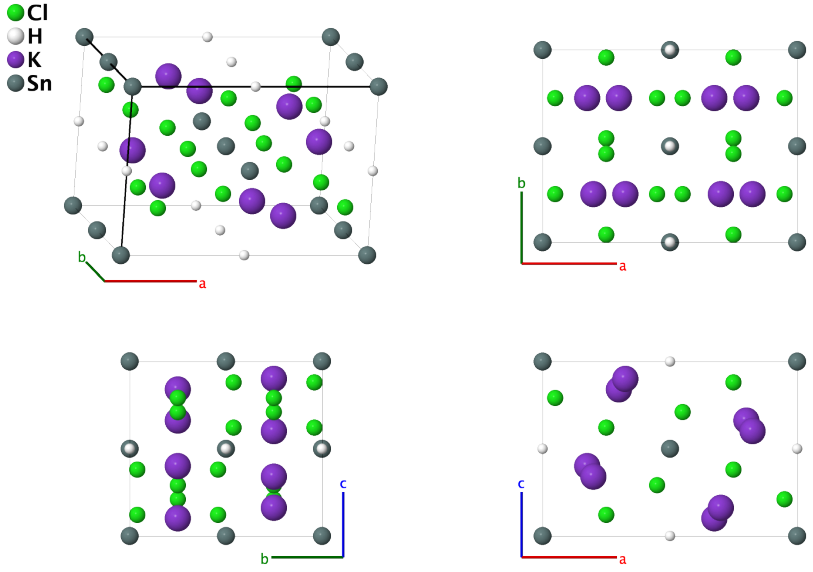
$K_2SnCl_4{\cdot}H_2O$ ($E3_5$) Structure: A4BC2D_oP32_62_2cd_b_2c_a

http://aflow.org/prototype-encyclopedia/A4BC2D_oP32_62_2cd_b_2c_a



Prototype	:	$Cl_4(H_2O)K_2Sn$
AFLOW prototype label	:	A4BC2D_oP32_62_2cd_b_2c_a
***Strukturbericht* designation**	:	$E3_5$
Pearson symbol	:	oP32
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A4BC2D_oP32_62_2cd_b_2c_a --params=`$a, b/a, c/a, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, y_7, z_7$

- This is the structure listed in (Hermann, 1939) as the $E3_5$ structure.
- (Kamenar, 1962) proposed a somewhat different version of the structure for this crystal. We have no clear indication as to which structure is correct.
- The positions of the hydrogen atoms in the water molecules were not determined, so we only give the positions of the oxygen atoms (labeled as H_2O).
- (Brasseur, 1939) gives the crystal structure and atomic positions in the *Pbnm* setting of space group #62. We have used FINDSYM to show the structure in the standard *Pnma* setting.
- (Hermann, 1939) gives incorrect values for the Wyckoff positions of the Cl III atoms. The correct coordinates are ($x_{\mathrm{ClIII}} = 0.79$, $y_{\mathrm{ClIII}} = +0.05$).

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

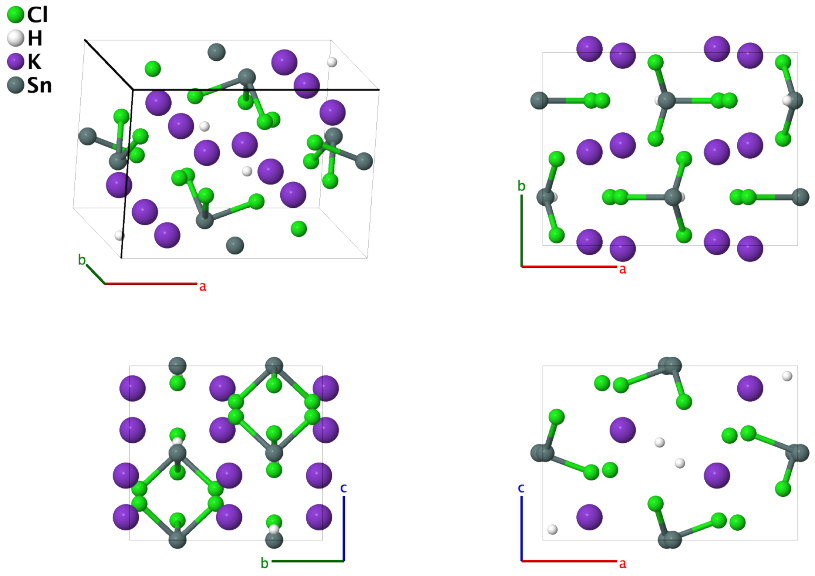
$K_2SnCl_4{\cdot}H_2O$ Structure: A4BC2D_oP32_62_2cd_c_d_c

http://aflow.org/prototype-encyclopedia/A4BC2D_oP32_62_2cd_c_d_c



Prototype	:	$Cl_4(H_2O)K_2Sn$
AFLOW prototype label	:	A4BC2D_oP32_62_2cd_c_d_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP32
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A4BC2D_oP32_62_2cd_c_d_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

- This is *not* the version of the structure given in (Hermann, 1939) as *Strukturbericht* $E3_3$. That structure was determined by (Brasseur, 1939). We have no clear indication as to which structure is correct.
- The positions of the hydrogen atoms in the water molecules were not determined, so we only give the positions of the oxygen atoms (labeled as H_2O).
- (Kamenar, 1962) gives the crystal structure and atomic positions in the *Pbnm* setting of space group #62. We have used FINDSYM to show the structure in the standard *Pnma* setting.

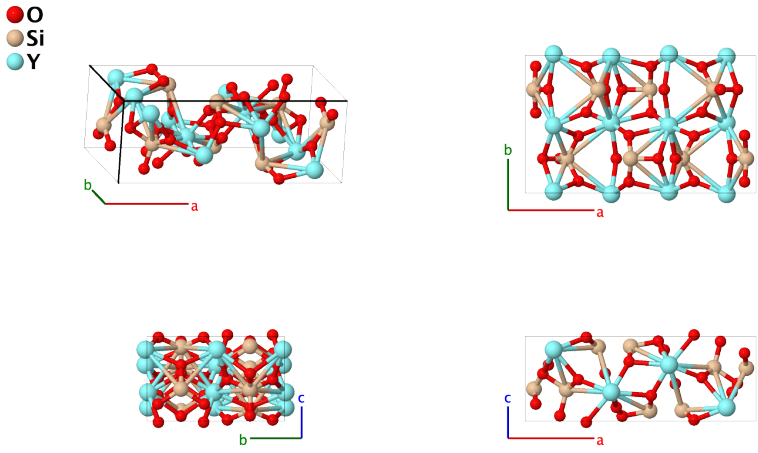
Possible δ-$Y_2Si_2O_7$ Structure: A7B2C2_oP44_62_3c2d_2c_d

http://aflow.org/prototype-encyclopedia/A7B2C2_oP44_62_3c2d_2c_d



Prototype	:	$O_7Si_2Y_2$
AFLOW prototype label	:	A7B2C2_oP44_62_3c2d_2c_d
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP44
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A7B2C2_oP44_62_3c2d_2c_d --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

Other compounds with this structure

- δ-$Ho_2O_7Si_2$, δ-$Dy_2O_7Si_2$, δ-$Y_2O_7Si_2$, and $Li_2S_2O_7$

- (Dias, 1990) found that some structures of $RE_2Si_2O_7$ (RE = Ho, Dy, Gd, Y) were in the centro-symmetric orthorhombic *Pnma* #62 space group, in which case this would be the prototype of δ-$RE_2Si_2O_7$ (Becerro, 2004). However, (Smolin, 1970) found δ-$Gd_2Si_2O_7$ to be in the non-centro-symmetric $Pna2_1$ #33 space group. (Becerro, 2004) found only one yttrium site in the δ-structure, supporting (Dias, 1990). In addition, if we allow a small amount of uncertainty (0.2 Å) in positions of the $Pna2_1$ structure, AFLOW-SYM and FINDSYM place this structure in the *Pnma* group. Nevertheless we have found no work explicitly stating that the structure of (Smolin, 1970) is in error, and indeed (Christensen, 1994) found δ-$Y_2Si_2O_7$ in space group $Pna2_1$. Given this ambiguity, we list $Y_2Si_2O_7$ only as a possible prototype for the δ-phase pyrosilicates.

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

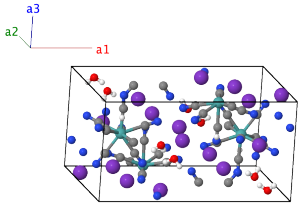
- (Hoard, 1939) originally determined this structure, but were unable to locate the hydrogen atoms. (Herrmann, 1943) gave this the *Strukturbericht* designation $F2_1$. (Typilo, 2010) were able to refine the structure at 173 K, including the hydrogen positions. Since the space group and Wyckoff positions are otherwise unchanged we use the newer structure as our prototype.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

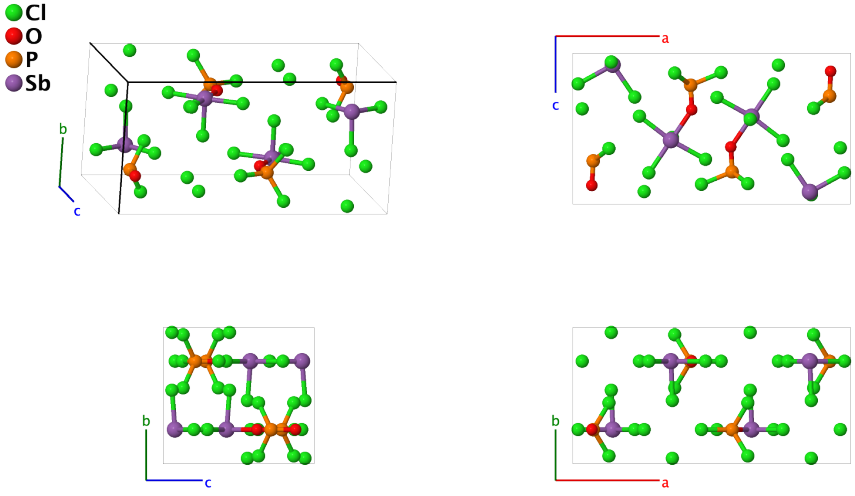
$SbCl_5 \cdot POCl_3$ Structure: A8BCD_oP44_62_4c2d_c_c_c

http://aflow.org/prototype-encyclopedia/A8BCD_oP44_62_4c2d_c_c_c



Prototype	:	Cl_8OPSb
AFLOW prototype label	:	A8BCD_oP44_62_4c2d_c_c_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP44
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=A8BCD_oP44_62_4c2d_c_c_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9$

Other compounds with this structure

- $SbCl_5 \cdot POCl_3(CH_3)_3$

- (Lindqvist, 1959) give the data for this structure in setting *Pmnb* of space group #62. We used FINDSYM to exchange the *a*- and *b*-axes so that the structure is now in the standard *Pnma* orientation.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

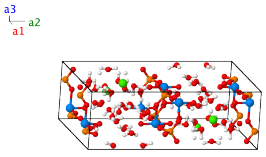
- Autunite, $Ca(UO_2)_2(PO_4)_2{\cdot}nH_2O$, is found in three varieties: naturally occurring Autunite, with $n \gtrsim 10$, and meta-autunite (I), which is partially dehydrated, $6 \gtrsim n \gtrsim 10$. Further dehydration in the laboratory produces meta-autunite (II).
- The original determination of the autunite structure designated $H5_9$ by (Herrmann, 1941) was a tetragonal structure, and none of the positions of the oxygen atom or water molecules were determined. (Locock, 2003) find a pseudo-tetragonal ($a \approx 2c$) unit cell which doubles the size of the original cell. They were able to locate all of the atoms in the structure.
- (Locock, 2003) found the ($4c$) calcium site to be occupied only 86% of the time.

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$



Basis vectors:

AFLOW prototype label	:	AB3C_oP20_62_c_3c_c
***Strukturbericht* designation**	:	$E2_4$
Pearson symbol	:	oP20
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=AB3C_oP20_62_c_3c_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5$

Other compounds with this structure

- $LaCrS_3$, $CeCrS_3$, $SmCrS_3$, $NdCrS_3$, $CeCrSe_3$, $PbSnS_3$, $RbCdBr_3$, $RbCdCl_3$, and $(Ti,Sn)_2S_3$

- (Brasseur, 1938) gave the Wyckoff positions in the *Pnam* setting of space group #62. We used FINDSYM to rotate the structure and put it in the standard *Pnma* setting.
- The hydrogen atoms for the NH_4 ions were not determined, so we only give the positions of the nitrogen atoms (labeled as NH_4).

Simple Orthorhombic primitive vectors:

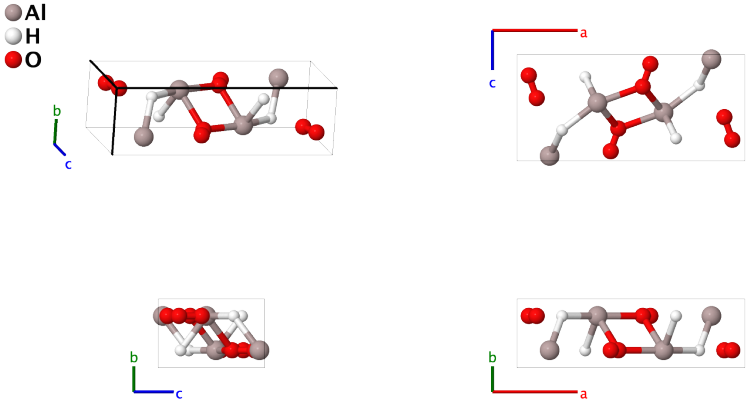
Diaspore ($AlOOH$, $E0_2$) Structure: ABC2_oP16_62_c_c_2c

http://aflow.org/prototype-encyclopedia/ABC2_oP16_62_c_c_2c



Prototype	:	$AlHO_2$
AFLOW prototype label	:	ABC2_oP16_62_c_c_2c
***Strukturbericht* designation**	:	$E0_2$
Pearson symbol	:	oP16
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=ABC2_oP16_62_c_c_2c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4$

Other compounds with this structure

- FeO(OH) (goethite) and MnO(OH) (groutite)

- (Hermann, 1937), following (Verway, 1935) designated this as *Strukturbericht* $E0_2$, but had no knowledge of the positions of the hydrogen atoms, which we take from (Hill, 1979) and which do not change the space group. Hill gave the Wyckoff positions of the atoms in terms of the *Pbnm* setting of space group #62. We used FINDSYM to transform this structure to the standard *Pnma* setting.

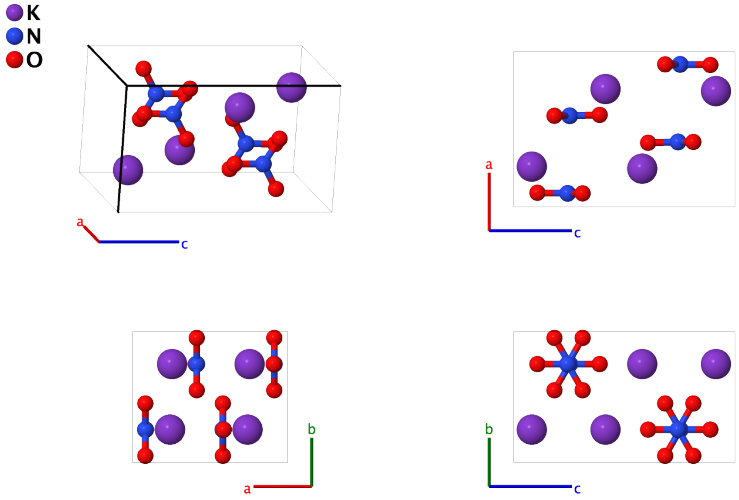
α-Potassium Nitrate (KNO_3) I Structure: ABC3_oP20_62_c_c_cd

http://aflow.org/prototype-encyclopedia/ABC3_oP20_62_c_c_cd.K.N.O3



Prototype	:	KNO_3
AFLOW prototype label	:	ABC3_oP20_62_c_c_cd
***Strukturbericht* designation**	:	None
Pearson symbol	:	oP20
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=ABC3_oP20_62_c_c_cd --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, y_4, z_4$

- Two possible structures have been identified for α-KNO_3: (Nimmo, 1973) proposed the current structure, which we call "Structure I", in space group *Pnma* #62. (Adiwidjaja, 2003) found this structure, but also noted that it could be described by a doubling of the current unit cell into a superstructure with space group $Cmc2_1$ #36, which we call "Structure II". It is unclear to us which structure is correct, so we present both of them.
- (Nimmo, 1973) determined the lattice constants and Wyckoff positions of the type I structure at 25 °C in the *Pmcn* setting of space group #62. We present the data in the standard *Pnma* setting.
- This structure has the same space group and Wyckoff positions as the MgB_4 (A4B_oP20_62_2cd_c) structure and the $G0_{10}$ $(NH_4)NO_3$ (ABC3_oP20_62_c_c_cd.N.NH4.O) structure, but the structures are all different. We give the previous two structures the noted AFLOW designations, and give this one the designation ABC3_oP20_62_c_c_cd.K.N.O3.
- On heating, α-KNO_3 transforms into β-KNO_3 at 128 °C. When heated above 200 °C and then cooled, the β-phase transforms into the metastable ferroelectric γ-KNO_3 phase, which can remain down to room temperature.

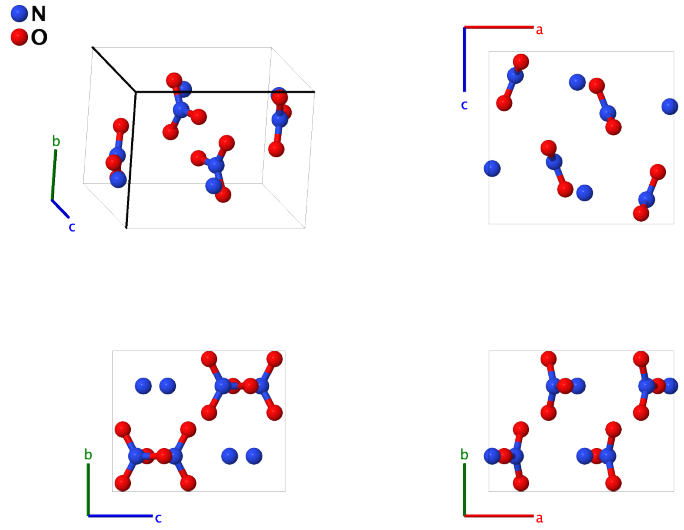
NH_4NO_3 III ($G0_{10}$) Structure: ABC3_oP20_62_c_c_cd

http://aflow.org/prototype-encyclopedia/ABC3_oP20_62_c_c_cd.N.NH4.O



Prototype	:	$N(NH_4)O_3$
AFLOW prototype label	:	ABC3_oP20_62_c_c_cd
***Strukturbericht* designation**	:	$G0_{10}$
Pearson symbol	:	oP20
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=ABC3_oP20_62_c_c_cd --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, y_4, z_4$

- Ammonium Nitrate exists in a variety of forms, (Hermann, 1937) depending on the temperature:

Phase	Temperature °C	*Strukturbericht*	Page	
I	125 – 170	$G0_8$	AB_cP2_221_a_b.NH4.NO3	
II	84 – 125	$G0_9$	ABC3_tP10_100_b_a_bc	
III	32 – 84	$G0_{10}$	ABC3_oP20_62_c_c_cd.N.NH4.O	(this structure)
IV	-17 – 32	$G0_{11}$	A4B2C3_oP18_59_ef_ab_af	
V	< −17	Gwihabaite	A4B2C3_tP72_77_8d_ab2c2d_6d2	

- Data for this structure was taken at 46 °C.
- It is likely that the NH_4 ions are free to rotate (Kracek, 1937).
- The positions of the hydrogen atoms in the NH_4 ions were not determined, so we only provide the positions of the nitrogen atoms (labeled as NH_4).
- (Goodwin, 1947) gave the structure in the *Pbnm* setting of space group #62. We used FINDSYM to change this to the standard *Pnma* setting.

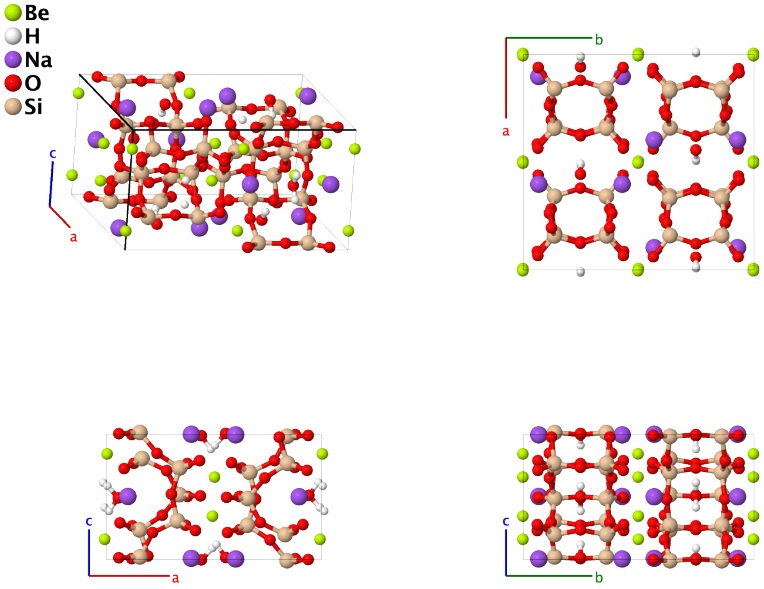
Epididymite ($BeHNaO_8Si_3$, $S4_7$) Structure: ABCD8E3_oP112_62_d_2c_d_4c6d_3d

http://aflow.org/prototype-encyclopedia/ABCD8E3_oP112_62_d_2c_d_4c6d_3d

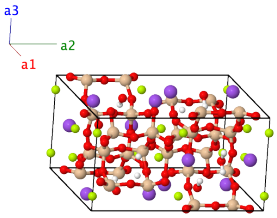


Prototype	:	$BeHNaO_8Si_3$
AFLOW prototype label	:	ABCD8E3_oP112_62_d_2c_d_4c6d_3d
***Strukturbericht* designation**	:	$S4_7$
Pearson symbol	:	oP112
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=ABCD8E3_oP112_62_d_2c_d_4c6d_3d --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4, x_5, z_5, x_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}, x_{16}, y_{16}, z_{16}, x_{17}, y_{17}, z_{17}$

- (Ito, 1934)'s original determination of the epididymite structure, designated as $S4_7$ by (Gottfried, 1937), was flawed, even in the author's estimation. In particular, both the Si-O and Si-Be distances are very small, with Si-Be less than 1Å. In addition, Ito and many later authors assumed that the hydrogen atoms formed OH radicals. (Diego Gatta, 2008) found that the hydrogen atoms were actually a part of a water molecule. Since the initial structure is not even suitable for starting first-principles calculations, while the new structure maintains the *Pnma* #62 space group, we have dropped the former and designate the later as $S4_7$.
- Epididymite and its dimorph, eudidymite, are two forms of hydrated sodium beryllium silicate which are stable under ambient conditions (Diego Gatta, 2008).

Simple Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$



Basis vectors:

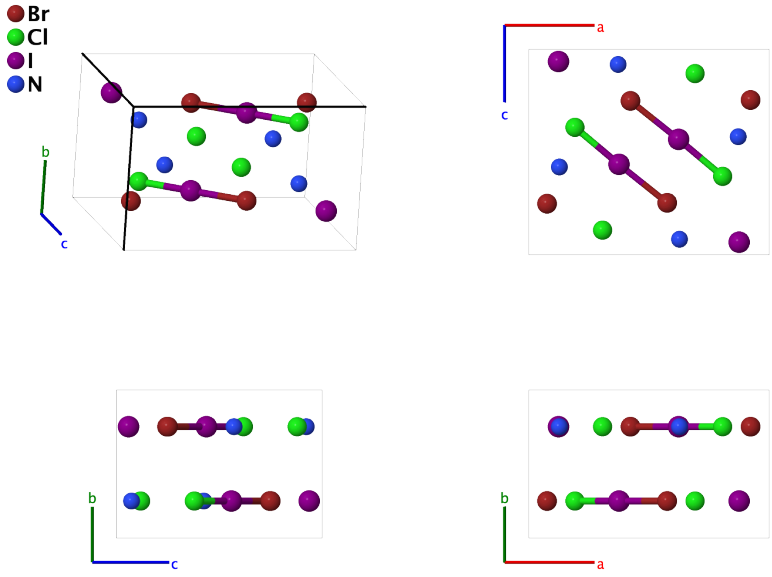
NH_4ClBrI ($F5_{14}$) Structure: ABCD_oP16_62_c_c_c_c

http://aflow.org/prototype-encyclopedia/ABCD_oP16_62_c_c_c_c

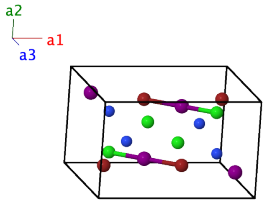


Prototype	:	$ClBrI(NH_4)$
AFLOW prototype label	:	ABCD_oP16_62_c_c_c_c
***Strukturbericht* designation**	:	$F5_{14}$
Pearson symbol	:	oP16
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=ABCD_oP16_62_c_c_c_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2, x_3, z_3, x_4, z_4$

- (Gottfried, 1937) originally described NH_4ClBrI as isostructural with NH_4I_3, $D0_{16}$, based on the early work of (Mooney, 1935). However, (Gottfried, 1940) used the newer work of (Mooney, 1937) to create a separate *Strukturbericht* designation for NH_4ClBrI, $F5_{14}$, even though this structure is still obviously related to NH_4I_3.
- The positions of the hydrogen atoms in the NH_4 were not determined, so we only provide the positions of the nitrogen atoms (labeled as NH_4).
- The original structure is given in the *Pmcn* setting of space group #62, which was transformed to the standard *Pnma* setting by FINDSYM. However, note that the coordinate transformations for the (4*c*) Wyckoff positions in (Gottfried, 1940) are erroneous, they give a structure in space group *Pmmn* #59. (Gottfried, 1937) has the correct tranformations in the $D0_{16}$ section.

Simple Orthorhombic primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

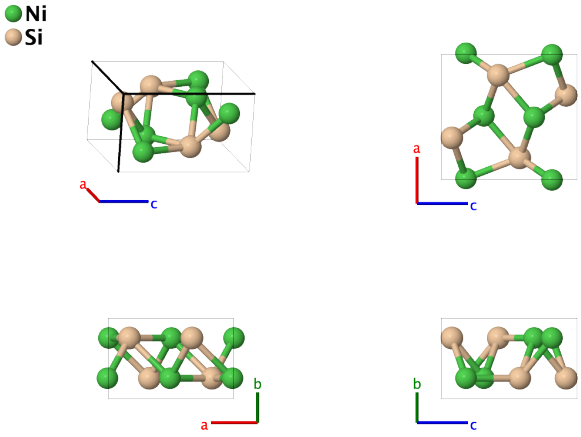
η-NiSi (B_d) Structure: AB_oP8_62_c_c

http://aflow.org/prototype-encyclopedia/AB_oP8_62_c_c.NiSi



Prototype	:	NiSi
AFLOW prototype label	:	AB_oP8_62_c_c
***Strukturbericht* designation**	:	B_d
Pearson symbol	:	oP8
Space group number	:	62
Space group symbol	:	*Pnma*
AFLOW prototype command	:	`aflow --proto=AB_oP8_62_c_c --params=`$a, b/a, c/a, x_1, z_1, x_2, z_2$

- (Toman, 1951) described this in the *Pbnm* setting of space group #62. We have used FINDSYM to transform this to the standard *Pnma* setting. Note that GeS (AB_oP8_62_c_c, GeS), MnP (AB_oP8_62_c_c, MnP), FeB (AB_oP8_62_c_c, FeB), and SnS (AB_oP8_62_c_c, SnS) have the same AFLOW prototype label. They are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.

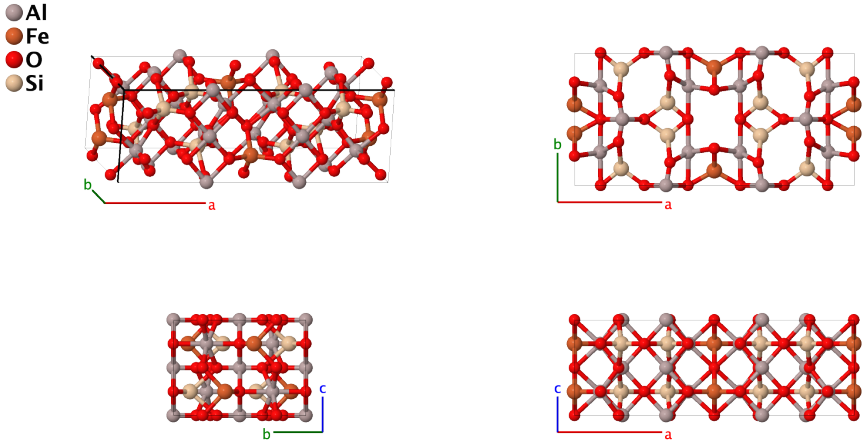
$S0_4$ (Staurolite, $Fe(OH)_2Al_4Si_2O_{10}$) (*obsolete*) Structure: A4BC12D2_oC76_63_eg_c_f3gh_g

http://aflow.org/prototype-encyclopedia/A4BC12D2_oC76_63_eg_c_f3gh_g



Prototype	:	$Al_4FeO_{12}Si_2$
AFLOW prototype label	:	A4BC12D2_oC76_63_eg_c_f3gh_g
***Strukturbericht* designation**	:	$S0_4$
Pearson symbol	:	oC76
Space group number	:	63
Space group symbol	:	*Cmcm*
AFLOW prototype command	:	`aflow --proto=A4BC12D2_oC76_63_eg_c_f3gh_g --params=`$a, b/a, c/a, y_1, x_2, y_3, z_3, x_4, y_4, x_5, y_5, x_6, y_6, x_7, y_7, x_8, y_8, x_9, y_9, z_9$

- This orthorhombic structure of staurolite determined by (Náray-Szabó, 1929) was given the *Strukturbericht* designation $S0_4$ by (Hermann, 1937). (Smith, 1968) showed that the structure is actually monoclinic with $\beta \approx 90°$, rather than orthorhombic and corrected the chemical composition of the mineral. Accordingly, we have marked this version of the structure as obsolete, but retain it for historical interest.
- One sixth of the oxygen sites listed here should actually be OH ions, but the positions of the hydrogen atoms were not given in (Náray-Szabó, 1929) and are labeled as O.
- We take our data from (Hermann, 1937), who presented it in the *Ccmm* representation of space group #63. We used FINDSYM to transform the structure to the standard *Cmcm* representation.
- (Hermann, 1937) also gave this the label $H5_4$ in the index.

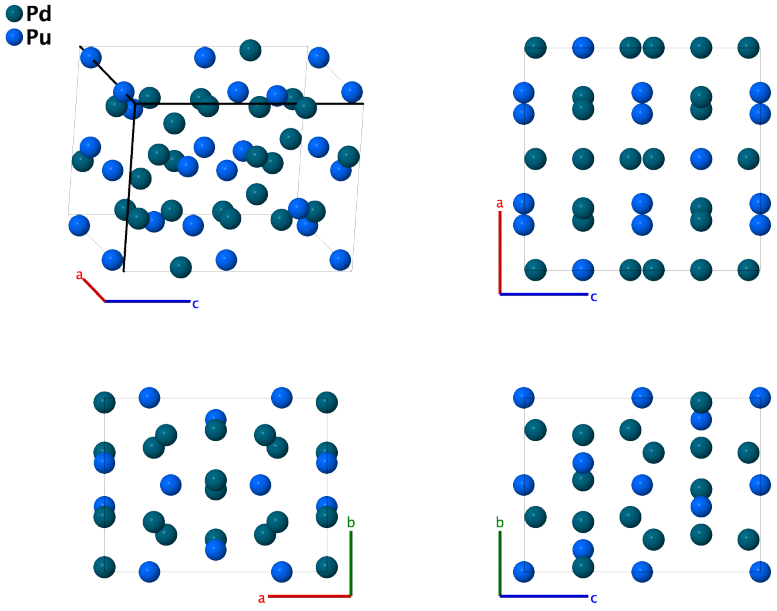
Pd_5Pu_3 Structure: A5B3_oC32_63_cfg_ce

http://aflow.org/prototype-encyclopedia/A5B3_oC32_63_cfg_ce



Prototype	:	Pd_5Pu_3
AFLOW prototype label	:	A5B3_oC32_63_cfg_ce
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC32
Space group number	:	63
Space group symbol	:	*Cmcm*
AFLOW prototype command	:	`aflow --proto=A5B3_oC32_63_cfg_ce --params=`$a, b/a, c/a, y_1, y_2, x_3, y_4, z_4, x_5, y_5$

Other compounds with this structure

- Ga_5Zr_3, In_5R_3 (R = Ce, Dy, Er, Gd, Ho, La, Lu, Nd, Pr, Sm, Tb, Th, Y), Pb_5Ba_3, Pd_5R_3 (R = Sc, Y, Gd-Lu), Rh_5Zr_3, Ga_5U_3, $(Mg_xSn_{1-x})_5La_3$, Sn_5La_3, Sn_5Sr_3, and Sn_5Yb_3

- Although (Massalski, 1990) lists Pd_5Pu_3 as the prototype for many structures, it is not shown in the assessed Pd-Pu phase diagram, which is based on data from 1967.
- (Cromer, 1976) states that this phase may be isostructural with Ga_5Zr_3, but at the time of publication the exact structure of that phase had not been solved.

Base-centered Orthorhombic primitive vectors:

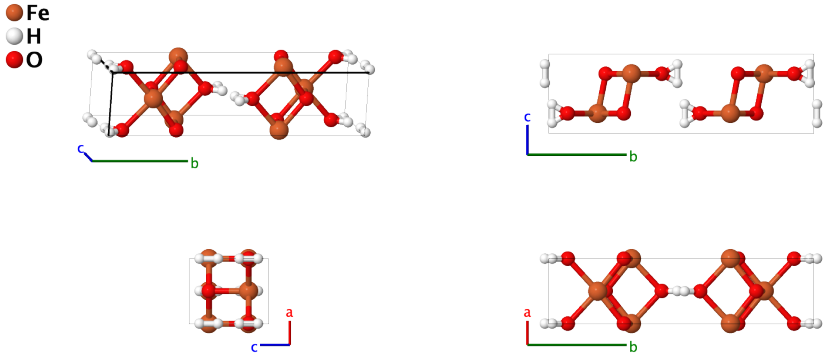
Lepidocrocite (γ-FeO(OH), $E0_4$) Structure: AB2C2_oC20_63_c_f_2c

http://aflow.org/prototype-encyclopedia/AB2C2_oC20_63_c_f_2c



Prototype	:	$FeHO_2$
AFLOW prototype label	:	AB2C2_oC20_63_c_f_2c
***Strukturbericht* designation**	:	$E0_4$
Pearson symbol	:	oC20
Space group number	:	63
Space group symbol	:	*Cmcm*
AFLOW prototype command	:	`aflow --proto=AB2C2_oC20_63_c_f_2c --params=`$a, b/a, c/a, y_1, y_2, y_3, y_4, z_4$

- (Gottfried, 1937) gave γ-FeO(OH) the *Strukturbericht* designation $E0_4$, but did not determine the positions of the hydrogens. Using a deuterated form of FeO(OH) (Christensen, 1982) found that the hydrogen atoms are located on the ($8f$) Wyckoff sites, but these sites are only 41.7% occupied. We use this structure as the prototype.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

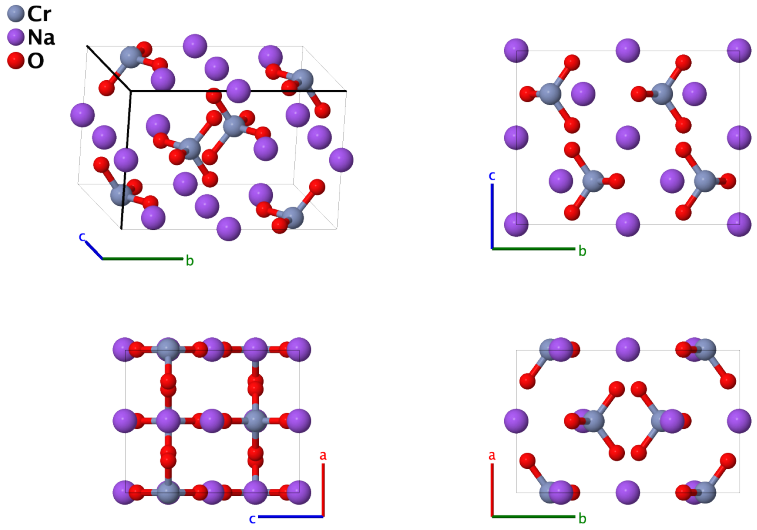
Na_2CrO_4 ($H1_8$) Structure: AB2C4_oC28_63_c_bc_fg

http://aflow.org/prototype-encyclopedia/AB2C4_oC28_63_c_bc_fg



Prototype	:	$CrNa_2O_4$
AFLOW prototype label	:	AB2C4_oC28_63_c_bc_fg
***Strukturbericht* designation**	:	$H1_8$
Pearson symbol	:	oC28
Space group number	:	63
Space group symbol	:	*Cmcm*
AFLOW prototype command	:	`aflow --proto=AB2C4_oC28_63_c_bc_fg --params=`$a, b/a, c/a, y_2, y_3, y_4, z_4, x_5, y_5$

Other compounds with this structure

- Li_2SO_4, $LiFeP_4$, Na_2FeO_4, Na_2SO_4 (III), $NaCaVO_4$, $NaMnPO_4$, $NaVCdO_4$, and Tl_2SeO_4

- This structure was originally determined by (Miller, 1936), who placed it in space group *Pnna* #52, and (Gottfried, 1938) uses this data for $H1_8$. Subsequently (Niggli, 1954) rather acerbically pointed out that Miller's coordinates were consistent with the more compact *Cmcm* #63 space group. This does not change the positions of the atoms in the conventional cell, so we use the compact structure as our prototype for *Strukturbericht* designation $H1_8$.
- This structure is stable up to 413 °C (Amirathanlingam, 1982).

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$

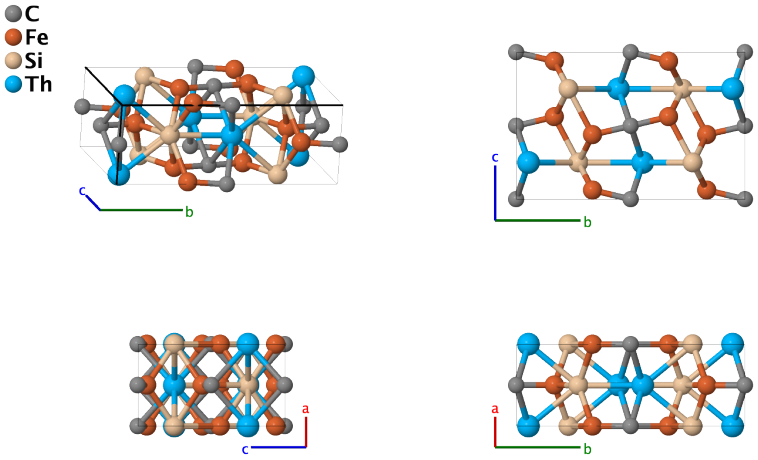
$ThFe_2SiC$ Structure: AB2CD_oC20_63_b_f_c_c

http://aflow.org/prototype-encyclopedia/AB2CD_oC20_63_b_f_c_c



Prototype	:	CFe_2SiTh
AFLOW prototype label	:	AB2CD_oC20_63_b_f_c_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC20
Space group number	:	63
Space group symbol	:	*Cmcm*
AFLOW prototype command	:	`aflow --proto=AB2CD_oC20_63_b_f_c_c --params=`$a, b/a, c/a, y_2, y_3, y_4, z_4$

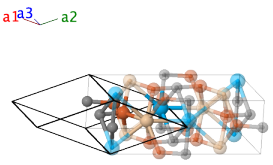
Other compounds with this structure

- AFe_2SiC, (A = Y, Sm, Gd, Tb, Ho, Er, Tm, Lu, U)

- This structure is a "filled" version of the Re_3B structure, with carbon atoms sitting in the ($4b$) Wyckoff positions. This is the quaternary version of the structure. The ternary version, where one of the ($4c$) Wyckoff positions has the same atom type as the ($8f$) site, is designated the V_3AsC structure.
- (Witte, 1994) does not designate a prototype for this structure, but as they only give full crystallographic data for the $ThFe_2SiC$ structure we will use this as the prototype.
- (Witte, 1994) lists the occupation of each site as Th (100.2%), Fe (97.7%), Si (96.0%), and C (97.0%), indicating that there are vacancies on the Fe, Si, and C sites, and that some of the Th atoms are either interstitial or occuping the other ($4c$) site or the ($8f$) site.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type

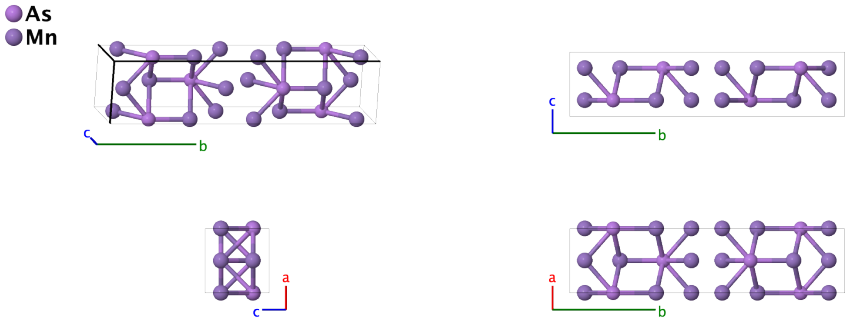
Mn_3As ($D0_d$) Structure: AB3_oC16_63_c_3c

http://aflow.org/prototype-encyclopedia/AB3_oC16_63_c_3c



Prototype	:	$AsMn_3$
AFLOW prototype label	:	AB3_oC16_63_c_3c
***Strukturbericht* designation**	:	$D0_d$
Pearson symbol	:	oC16
Space group number	:	63
Space group symbol	:	*Cmcm*
AFLOW prototype command	:	`aflow --proto=AB3_oC16_63_c_3c --params=`$a, b/a, c/a, y_1, y_2, y_3, y_4$

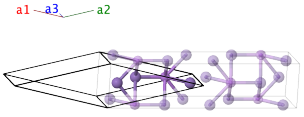
Other compounds with this structure

- Te_3Nd, $DyGe_3$

- (Nowotny, 1951) set the structure of Mn_3As in space group *Pmmn* #59. This was repeated by (Villars, 1991) and (Brandes, 1992). However, (Carrillo-Cabrera, 1983) showed that the structure actually reduces to space group *Cmcm* #63, and this was recognized by (Parthé, 1993). We follow the latter two works and assign the $D0_d$ structure to space group *Cmcm*.
- (Carrillo-Cabrera, 1983) placed the structure in setting *Bmmb* of space group #63, but we have shifted it to the standard *Cmcm* setting.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$-y_1\,\mathbf{a}_1 + y_1\,\mathbf{a}_2 + \frac{1}{4}\,\mathbf{a}_3$	=	$y_1 b\,\hat{\mathbf{y}} + \frac{1}{4}c\,\hat{\mathbf{z}}$	($4c$)	As

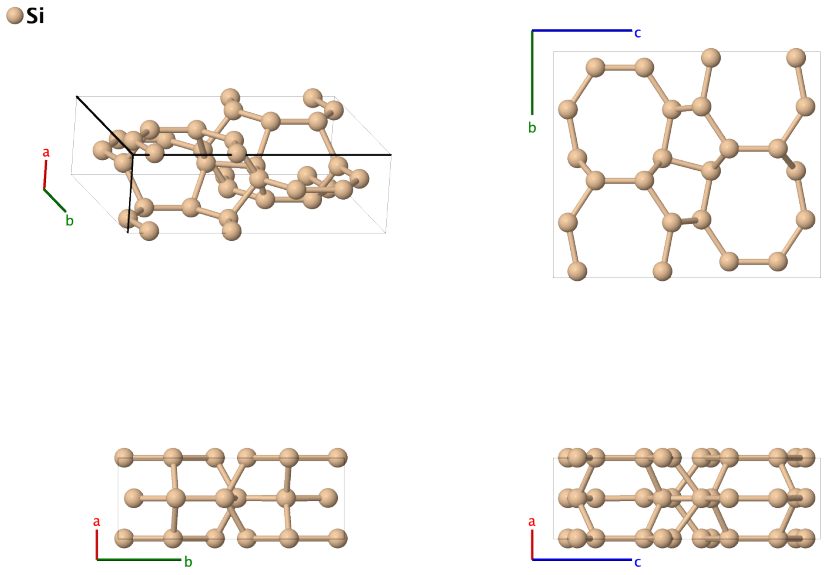
Si_{24} Clathrate Structure: A_oC24_63_3f

http://aflow.org/prototype-encyclopedia/A_oC24_63_3f

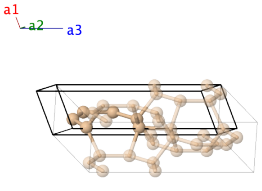


Prototype	:	Si_{24}
AFLOW prototype label	:	A_oC24_63_3f
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC24
Space group number	:	63
Space group symbol	:	*Cmcm*
AFLOW prototype command	:	`aflow --proto=A_oC24_63_3f --params=`$a, b/a, c/a, y_1, z_1, y_2, z_2, y_3, z_3$

- Unlike the Si_{34} and Si_{46} clathrates, this is an experimentally determined structure, prepared by removing sodium atoms from an Na_4Si_{24} predecessor.
- There is no consistency in the naming of these clathrate structures. Si_{34} and Si_{46} were named by their authors based on the size of the primitive unit cell. Here, (Kim, 2015) has chosen to name the structure based on the size of the conventional cell. For now, at least, we will follow the authors' naming schemes for these structures.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$-y_1\,\mathbf{a}_1 + y_1\,\mathbf{a}_2 + z_1\,\mathbf{a}_3$	=	$y_1 b\,\hat{\mathbf{y}} + z_1 c\,\hat{\mathbf{z}}$	$(8f)$	Si I

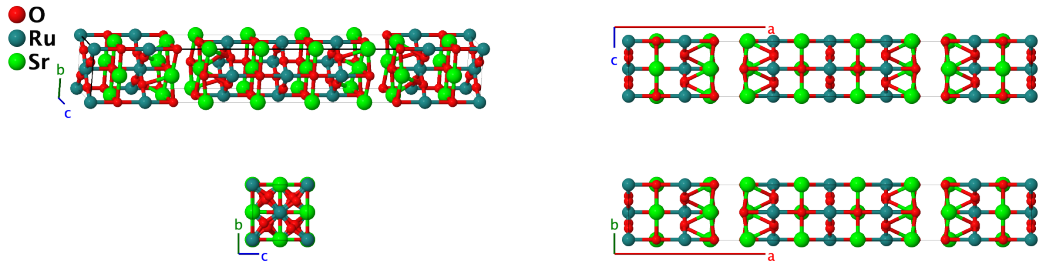
Base-centered orthorhombic $Sr_4Ru_3O_{10}$ Structure: A10B3C4_oC68_64_2dfg_ad_2d

http://aflow.org/prototype-encyclopedia/A10B3C4_oC68_64_2dfg_ad_2d

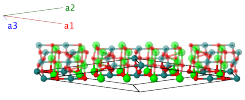


Prototype	:	$O_{10}Ru_3Sr_4$
AFLOW prototype label	:	A10B3C4_oC68_64_2dfg_ad_2d
***Strukturbericht* designation**	:	None
Pearson symbol	:	oC68
Space group number	:	64
Space group symbol	:	*Cmca*
AFLOW prototype command	:	`aflow --proto=A10B3C4_oC68_64_2dfg_ad_2d --params=`$a, b/a, c/a, x_2, x_3, x_4, x_5, x_6, y_7, z_7, x_8, y_8, z_8$

- (Crawford, 2002) placed $Sr_4Ru_3O_{10}$ in space group *Pbam* #55, oP68, but found that it was very close to the current structure. Indeed, we derived this structure from the original structure by allowing a small amount of uncertainty in the atomic positions. In both cases, the structure consists of triple-layer ruthenate separated by 2.37 Å. In the original structure, there are two of these layers in the primitive cell which are not equivalent. In the current structure there is only one triple-layer in the *primitive base-centered cell*, and so the layers in the *conventional* cell are equivalent.

Base-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

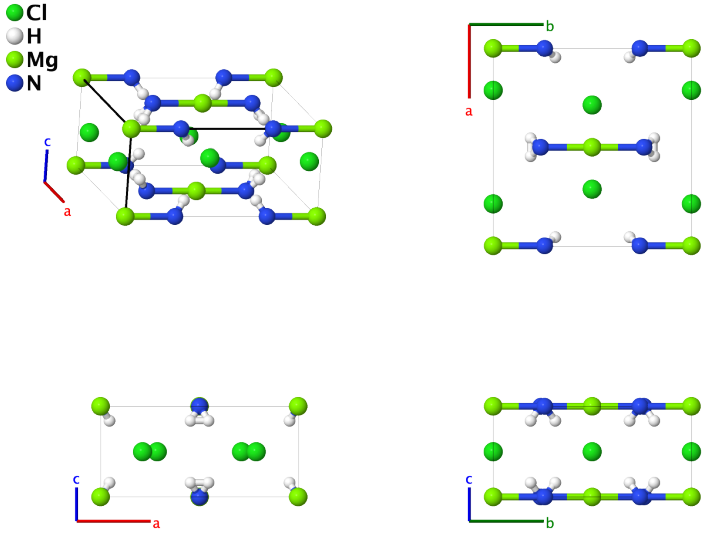
$Mg(NH_3)_2Cl_2$ ($E1_3$) Structure: A2B8CD2_oC26_65_h_r_a_i

http://aflow.org/prototype-encyclopedia/A2B8CD2_oC26_65_h_r_a_i



Prototype	:	$Cl_2H_6MgN_2$
AFLOW prototype label	:	A2B8CD2_oC26_65_h_r_a_i
***Strukturbericht* designation**	:	$E1_3$
Pearson symbol	:	oC26
Space group number	:	65
Space group symbol	:	*Cmmm*
AFLOW prototype command	:	`aflow --proto=A2B8CD2_oC26_65_h_r_a_i --params=`$a, b/a, c/a, x_2, y_3, x_4, y_4, z_4$

Other compounds with this structure

- $Cd(NH_3)_2Cl_2$, $Mg(NH_3)_2Cl_2$, $Hg(NH_3)_2Cl_2$, $Ni(NH_3)_2Br_2$, $Ni(NH_3)_2Cl_2$, and $Ni(NH_3)_2I_2$

- (Gottfried, 1938) gave the $E1_3$ designation to $Cd(NH_3)_2Cl_2$, and gave coordinates in the *Cmm*2 #35 space group. However, the cited reference, (MacGillavry, 1936) noted that their coordinates allowed several different space groups, with *Cmmm* #65 having the highest symmetry. We therefore follow most authors and use the *Cmmm* representation.
- (MacGillavry, 1936) could not determine the positions of the hydrogen atoms, but (Leineweber, 1999) was able to do this using the isostructural compound $Mg(NH_3)_2Cl_2$. Accordingly, we use $Mg(NH_3)_2Cl_2$ for the prototype of $E1_3$.
- Twelve hydrogen atoms are statistically distributed among the (16*r*) positions, so each site has a 75% probability of being occupied.

Base-centered Orthorhombic primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,b\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

- (Zachriasen, 1934) state that the H atoms in the ammonium ion must be along the lines between the nitrogen and oxygen atoms, but give no further information.
- The positions of the hydrogen atoms in the NH_4 ions were not determined, so we only provide the position of the nitrogen atoms (labeled as NH_4).
- The data for this structure was presented in the *Acmm* setting of space group #67. We transformed this to the standard *Cmma* setting using FINDSYM.

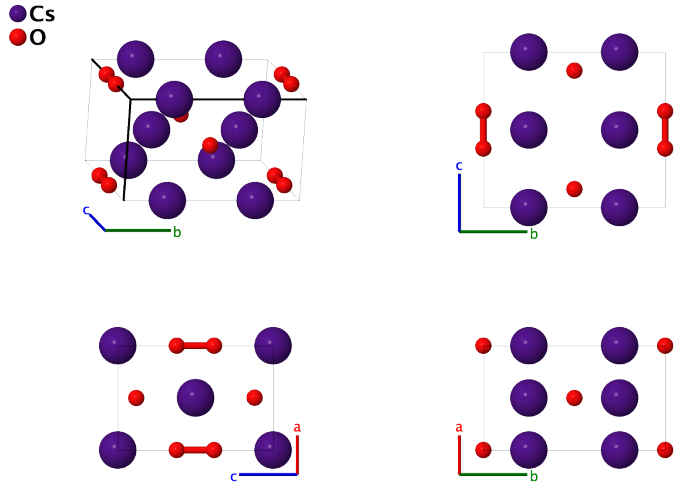
CsO Structure: AB_oI8_71_g_i

http://aflow.org/prototype-encyclopedia/AB_oI8_71_g_i

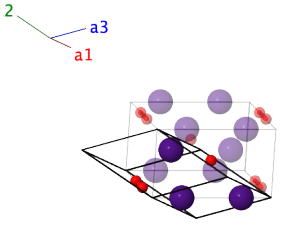


Prototype	:	CsO
AFLOW prototype label	:	AB_oI8_71_g_i
***Strukturbericht* designation**	:	None
Pearson symbol	:	oI8
Space group number	:	71
Space group symbol	:	*Immm*
AFLOW prototype command	:	`aflow --proto=AB_oI8_71_g_i --params=`$a, b/a, c/a, y_1, z_2$

- (Massalski, 1990) credits the discovery of this structure to (Rengade, 1909), but we have been unable to obtain a copy of this reference. (Downs, 2003) quotes (Wyckoff, 1963) giving an *Immm*-oI8 structure for CsO. Since this is the same space group and Pearson symbol as found in Massalski, we use Wyckoff's data.

Body-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}b\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}} - \frac{1}{2}c\,\hat{\mathbf{z}}$$



Basis vectors:

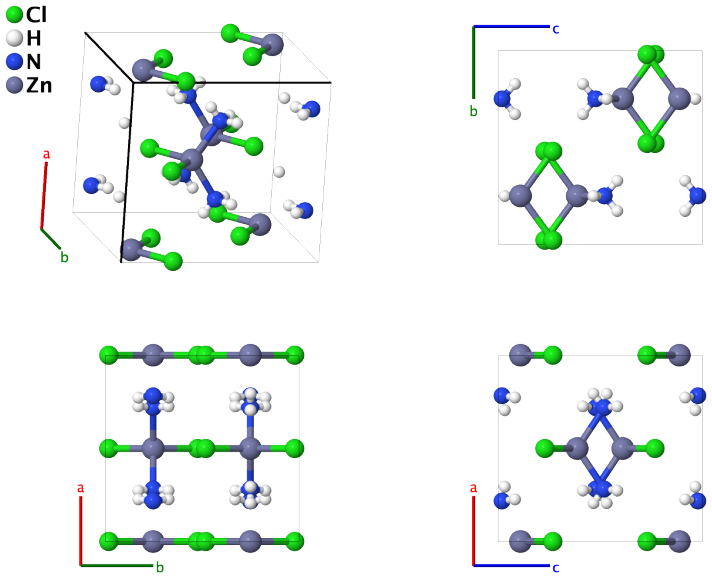
$Zn(NH_3)_2Cl_2$ ($E1_2$) Structure: A2B6C2D_oI44_74_h_ij_i_e

http://aflow.org/prototype-encyclopedia/A2B6C2D_oI44_74_h_ij_i_e



Prototype	:	$Cl_2H_6N_2Zn$
AFLOW prototype label	:	A2B6C2D_oI44_74_h_ij_i_e
***Strukturbericht* designation**	:	$E1_2$
Pearson symbol	:	oI44
Space group number	:	74
Space group symbol	:	*Imma*
AFLOW prototype command	:	`aflow --proto=A2B6C2D_oI44_74_h_ij_i_e --params=`$a, b/a, c/a, z_1, y_2, z_2, x_3, z_3, x_4, z_4, x_5, y_5, z_5$

Other compounds with this structure

- $Zn(NH_3)_2Br_2$

- The recent work of (Ivšić, 2019) studied this system at 100 K and were able to locate the hydrogen atoms. The positions of the other atoms are similar to those in earlier works such as (Yamaguchi, 1981) and the space group is unchanged, so we use this as the prototype for the $E1_2$ label.

Body-centered Orthorhombic primitive vectors:

$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}b\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$

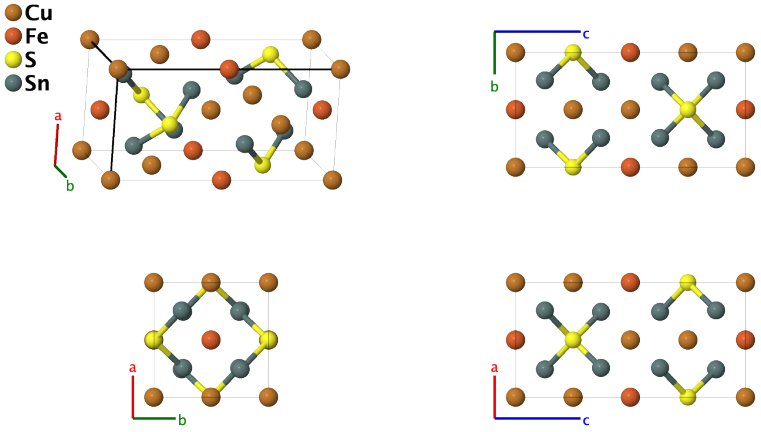
Kesterite [$Cu_2(Zn,Fe)SnS_4$] Structure: A2BCD4_tI16_82_ac_b_d_g

http://aflow.org/prototype-encyclopedia/A2BCD4_tI16_82_ac_b_d_g

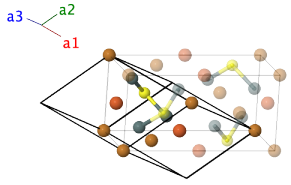


Prototype	:	$Cu_2(Fe,Zn)SnS_4$
AFLOW prototype label	:	A2BCD4_tI16_82_ac_b_d_g
***Strukturbericht* designation**	:	None
Pearson symbol	:	tI16
Space group number	:	82
Space group symbol	:	$I\bar{4}$
AFLOW prototype command	:	`aflow --proto=A2BCD4_tI16_82_ac_b_d_g --params=`$a, c/a, x_5, y_5, z_5$

- The kesterite structure is related to the stannite structure, with differences occurring due to the positioning of the Cu atoms (Hall, 1978). The (2*b*) Wyckoff position is partially occupied with Zn and Fe; however, we decorate it with Fe only.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} - \tfrac{1}{2}c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	(2*a*)	Cu I

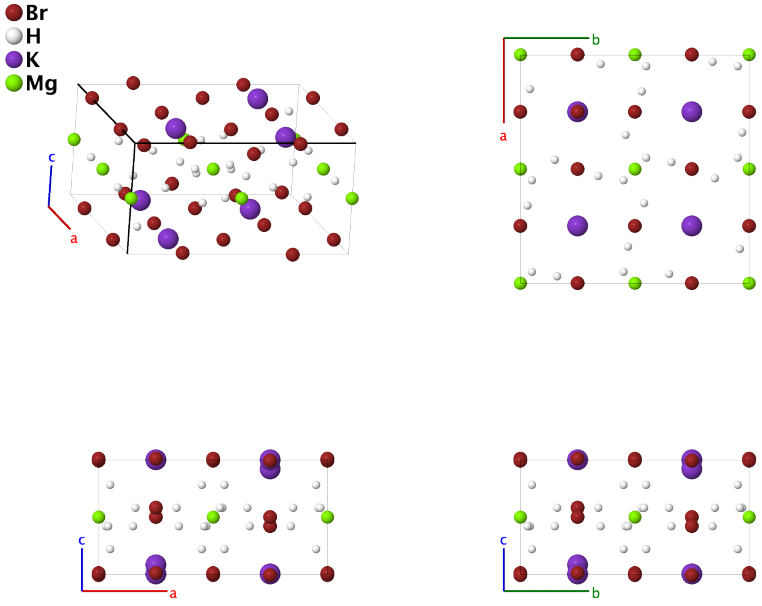
Bromocarnallite ($KMg(H_2O)_6(Cl,Br)_3$, $E2_6$) Structure: A3B6CD_tP44_85_bcg_3g_ac_e

http://aflow.org/prototype-encyclopedia/A3B6CD_tP44_85_bcg_3g_ac_e

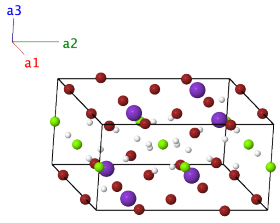


Prototype	:	$(Br,Cl)_3(H_2O)_6KMg$
AFLOW prototype label	:	A3B6CD_tP44_85_bcg_3g_ac_e
***Strukturbericht* designation**	:	$E2_6$
Pearson symbol	:	tP44
Space group number	:	85
Space group symbol	:	$P4/n$
AFLOW prototype command	:	`aflow --proto=A3B6CD_tP44_85_bcg_3g_ac_e --params=`$a, c/a, z_3, z_4, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9$

- (Andreß, 1939) first determined the structure of bromocarnallite, using a sample with 75% bromine on the halide site. They were unable to locate the hydrogen atoms, and placed the compound in space group $P4/n$ #85. The data was given by (Hermann, 1939) in setting 1 of this group, but we used FINDSYM to place it in the standard setting 2.
- (Hermann, 1939) assigned this compound the *Strukturbericht* symbol $E2_6$.
- (Schlemper, 1985) re-examined the structure for the pure chlorine version, carnallite. They located the hydrogen atoms and placed the system in space group *Pnna* #52. We present this structure in the carnallite structure page.

Simple Tetragonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$



Basis vectors:

- (Wilhelmi, 1970) has a misprint for the Wyckoff position of the Nd-II atom, although the nearest-neighbor distances are correct. (Downs, 2003) corrects the position to be consistent with those distances, and we use their value.

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

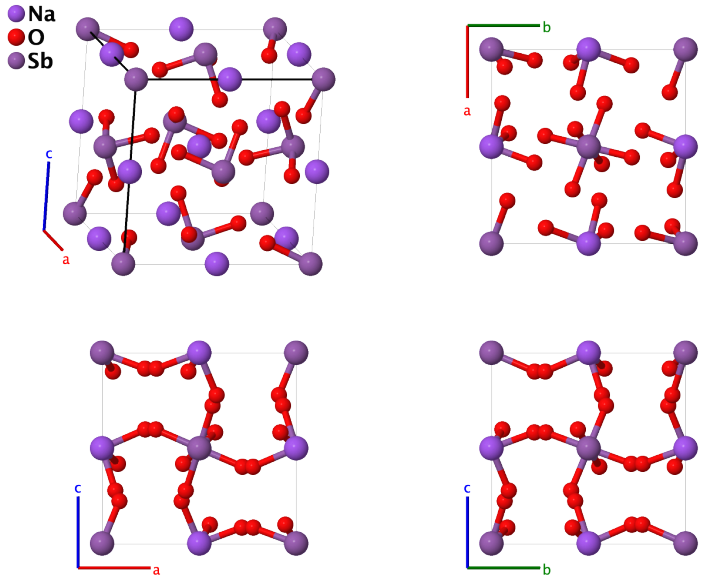
$NaSb(OH)_6$ ($J1_{11}$) Structure: AB6C_tP32_86_d_3g_c

http://aflow.org/prototype-encyclopedia/AB6C_tP32_86_d_3g_c



Prototype	:	$Na(OH)_6Sb$
AFLOW prototype label	:	AB6C_tP32_86_d_3g_c
***Strukturbericht* designation**	:	$J1_{11}$
Pearson symbol	:	tP32
Space group number	:	86
Space group symbol	:	$P4_2/n$
AFLOW prototype command	:	`aflow --proto=AB6C_tP32_86_d_3g_c --params=`$a, c/a, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5$

Other compounds with this structure

- $AgSb(OH)_6$

- The atomic positions were originally determined using setting 1 of space group #86. We used FINDSYM to change the origin to setting 2.
- The positions of the hydrogen atoms in the OH ion were not determined, so we only provide the positions of the oxygen atoms (labeled as OH).
- Although the replacement of fluorine by OH does not affect the shape of the Sb-$(F,OH)_6$ ions, it has a profound effect on the structure, as can be seen by looking at $NaSbF_6$ and $NaSbF_4(OH)_2$ ($J1_{12}$).

Simple Tetragonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

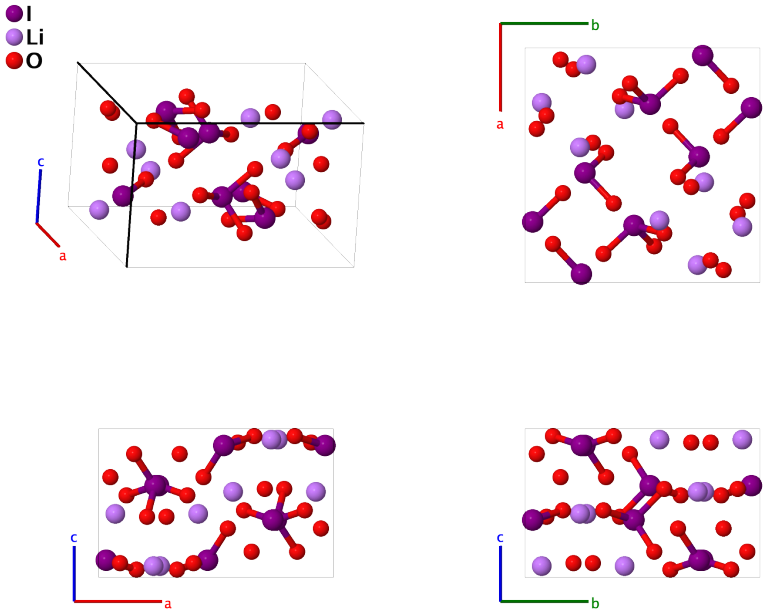
β-$LiIO_3$ Structure: ABC3_tP40_86_g_g_3g

http://aflow.org/prototype-encyclopedia/ABC3_tP40_86_g_g_3g

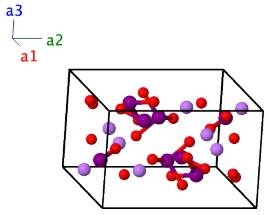


Prototype	:	$ILiO_3$
AFLOW prototype label	:	ABC3_tP40_86_g_g_3g
***Strukturbericht* designation**	:	None
Pearson symbol	:	tP40
Space group number	:	86
Space group symbol	:	$P4_2/n$
AFLOW prototype command	:	`aflow --proto=ABC3_tP40_86_g_g_3g --params=`$a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5$

- $LiIO_3$ is known to exist in three forms:
  - α-$LiIO_3$, stable below 473 K: (Zachariasen, 1931) originally determined that the structure of α-$LiIO_3$ was in space group $P6_322$ #182, which (Hermann, 1937) designated *Strukturbericht* $E2_3$. (Rosenzweig, 1966) subsequently determined that the true structure was in space group $P6_3$ #173.
  - β-$LiIO_3$, stable from 573 K up to the melting point at 708 K (this structure).
  - γ-$LiIO_3$, stable between the α- and β-phases, with an orthorhombic structure in space group $Pna2_1$ #33.

Simple Tetragonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$



Basis vectors:

Space group number	:	87
Space group symbol	:	$I4/m$
AFLOW prototype command	:	`aflow --proto=AB4C24D12_tI82_87_a_h_2h2i_hi --params=`$a, c/a, x_2, y_2, x_3, y_3, x_4, y_4, x_5, y_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- (Papike, 1965) found that the composition of the Si-II (16*i*) site was actually $Al_{0.458}Si_{0.542}$. This is richer in aluminum than assumed by Pauling, who gave the total aluminum/silicon composition as $AlSi_3$ (Pauling, 1930). If we assume that the Si-I (8*h*) site is only filled by silicon atoms, then Pauling's composition for the Si-II site is $Al_{0.375}Si_{0.625}$. The name "marialite" scapolite distinguishes this from meionite scapolite, which replaces the sodium atoms by calcium but also includes SiO_4 and CO_3, which replace the chlorine atoms. According to Pauling, "The minerals of the scapolite group can be considered as solid solution of two end-members, marialite, $Na_4Al_3Si_9O_{24}Cl$, and meionite, $Ca_4Al_6Si_6O_{24}(SO_4,CO_3)$, in various proportions."
- Since the Al-Si sites are partially occupied with a higher concentration of Si, the positions are labeled as Si.

Body-centered Tetragonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\end{aligned}$$

Other compounds with this structure

- Sr_2MgWO_6

- This double perovskite crystal is the ground state structure of Sr_2NiWO_6. Above 300 °C, it transforms into the cubic perovskite $E2_1$ structure. (Iwanga, 2000) places the strontium atoms on the (4*c*) Wyckoff position, but gives the coordinates for the (4*d*) site. The interatomic distances they give with this structure are consistent with the (4*d*) site.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} - \frac{1}{2}c\,\hat{\mathbf{z}}$$

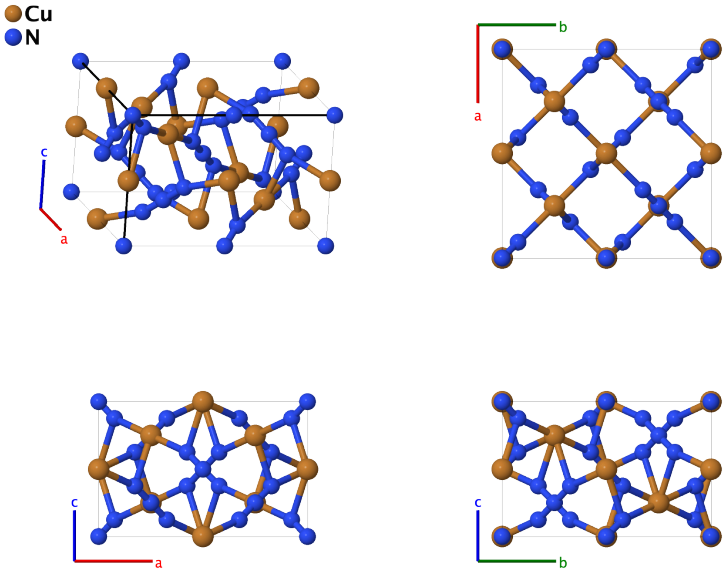
Copper (I) Azide (CuN_3) Structure: AB3_tI32_88_d_cf

http://aflow.org/prototype-encyclopedia/AB3_tI32_88_d_cf



Prototype	:	CuN_3
AFLOW prototype label	:	AB3_tI32_88_d_cf
***Strukturbericht* designation**	:	None
Pearson symbol	:	tI32
Space group number	:	88
Space group symbol	:	$I4_1/a$
AFLOW prototype command	:	`aflow --proto=AB3_tI32_88_d_cf --params=`$a, c/a, x_3, y_3, z_3$

Other compounds with this structure

- AgN_3 and TiN_3

- Not to be confused with Copper (II) Azide, $Cu(N_3)_2$, an explosive.
- (Wilsdorf, 1948) gave the Wyckoff positions in setting 1 of space group #88. We used FINDSYM to translate this to the standard setting 2.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$

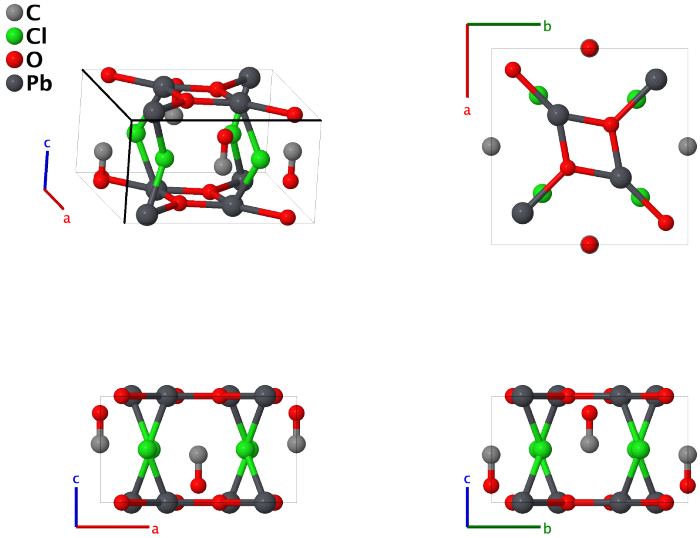
$G7_5$ ($PbCO_3 \cdot PbCl_2$, Phosgenite) (*obsolete*) Structure: AB2C3D2_tP16_90_c_f_ce_e

http://aflow.org/prototype-encyclopedia/AB2C3D2_tP16_90_c_f_ce_e



Prototype	:	$CCl_2O_3Pb_2$
AFLOW prototype label	:	AB2C3D2_tP16_90_c_f_ce_e
***Strukturbericht* designation**	:	$G7_5$
Pearson symbol	:	tP16
Space group number	:	90
Space group symbol	:	$P42_12$
AFLOW prototype command	:	`aflow --proto=AB2C3D2_tP16_90_c_f_ce_e --params=`$a, c/a, z_1, z_2, x_3, x_4, x_5$

- (Onorato, 1934) made an early determination of the structure of phosgenite, and (Gottfried, 1937) assigned it the *Strukturbericht* designation $G7_5$. However, the "proposed structure [was] based on photographic data and partly on steric considerations" (Giuseppetti, 1974). Subsequent investigations showed that the true phosgenite structure was in space group $P4/mbm$ #127. We list the original structure here as part of the historical record.

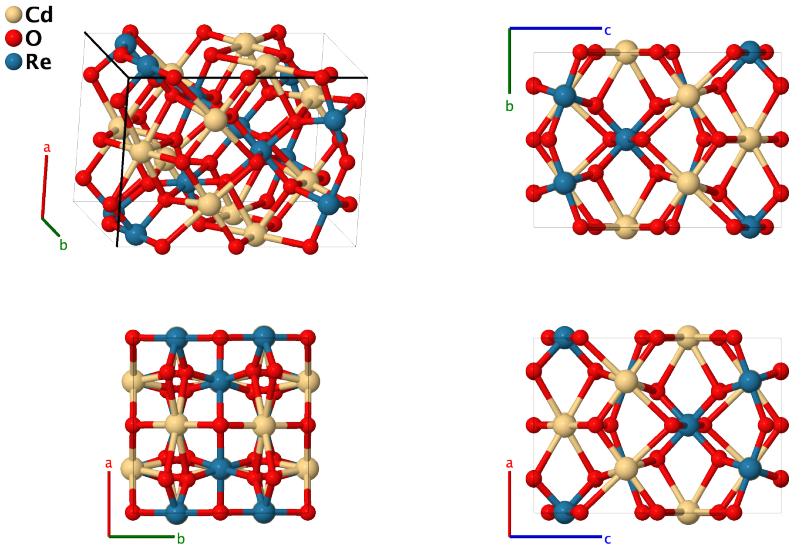
Phase III $Cd_2Re_2O_7$ Structure: A2B7C2_tI44_98_f_bcde_f

http://aflow.org/prototype-encyclopedia/A2B7C2_tI44_98_f_bcde_f



Prototype	:	$Cd_2O_7Re_2$
AFLOW prototype label	:	A2B7C2_tI44_98_f_bcde_f
***Strukturbericht* designation**	:	None
Pearson symbol	:	tI44
Space group number	:	98
Space group symbol	:	$I4_122$
AFLOW prototype command	:	`aflow --proto=A2B7C2_tI44_98_f_bcde_f --params=`$a, c/a, z_2, x_3, x_4, x_5, x_6$

- $Cd_2Re_2O_7$ exhibits a number of phases. We will use the notation of (Kapcia, 2019) to describe them:
-
  - Phase I: above 200 K, the system takes on the cubic pyrochlore ($E8_1$) structure.
  - Phase II: in the range 120-200 K the system is in the tetragonal $I\bar{4}m2$ #119 structure.
  - Phase III: in the range 80-120 K the system is in the tetragonal $I4_122$ #98 structure (this structure).
  - Phase IV: (Kapcia, 2019) did a first-principles study of this system and found that below 80 K Phase III develops a soft phonon mode which transforms the system into an orthorhombic $F222$ #22 structure.
  - (Norman, 2019) points out that both Phase III and Phase IV structures have issues.
- Both Phase II and Phase III are extremely close to Phase I. If AFLOW-SYM and FINDSYM allow a 0.2 Å uncertainty in lattice vectors and atomic positions both of the tetragonal phases become cubic.
- Phase IV is extremely close to Phase II. If AFLOW-SYM and FINDSYM allow a 0.002 Å uncertainty in the lattice vectors and atomic positions the orthorhombic phase becomes tetragonal.
- Data for the Phase III structure was taken at 90 K.

Body-centered Tetragonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\end{aligned}$$

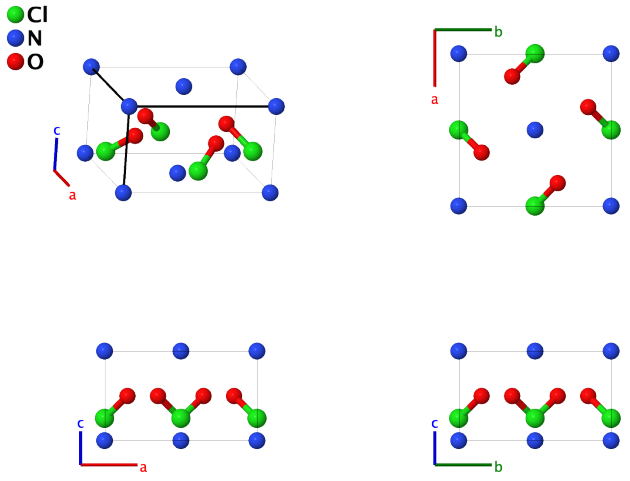
$F5_4$ (NH_4ClO_2) (*obsolete*) Structure: ABC2_tP8_100_b_a_c

http://aflow.org/prototype-encyclopedia/ABC2_tP8_100_b_a_c

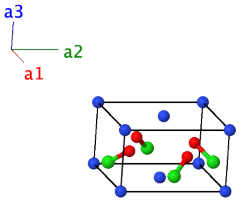


Prototype	:	$Cl(NH_4)O_2$
AFLOW prototype label	:	ABC2_tP8_100_b_a_c
***Strukturbericht* designation**	:	$F5_4$
Pearson symbol	:	tP8
Space group number	:	100
Space group symbol	:	*P*4*bm*
AFLOW prototype command	:	`aflow --proto=ABC2_tP8_100_b_a_c --params=`$a, c/a, z_1, z_2, x_3, z_3$

- (Levi, 1931) first detemined this structure, but they were actually looking at a combination of ammonium chlorite, NH_4ClO_2 and ammonium chlorate, NH_4ClO_3, which takes on the γ-KNO_3 structure. In addition, they were unable to determine the positions of the hydrogen atoms, and it appears that space group *P*4*bm* #100 is incompatible with having four hydrogen atoms in a tetrahedral arrangement about the nitrogen atom. (Smolentsev, 2005) determined the positions of the hydrogen atoms, and placed this structure in space group $P\bar{4}2_1m$ #113, making the structure of (Levi, 1931) obsolete. We present it here for historical interest.
- Since the position of the hydrogen atoms in the NH_4 ions were not determined, we only provide the nitrogen atom positions (labeled as NH_4).

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

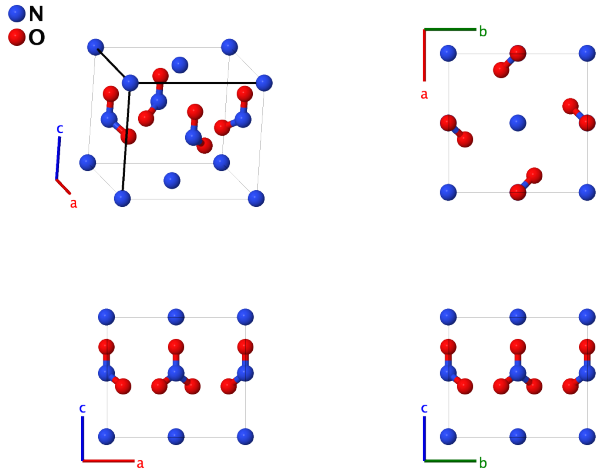
NH_4NO_3 II ($G0_9$) Structure: ABC3_tP10_100_b_a_bc

http://aflow.org/prototype-encyclopedia/ABC3_tP10_100_b_a_bc



Prototype	:	$N(NH_4)O_3$
AFLOW prototype label	:	ABC3_tP10_100_b_a_bc
***Strukturbericht* designation**	:	$G0_9$
Pearson symbol	:	tP10
Space group number	:	100
Space group symbol	:	*P*4*bm*
AFLOW prototype command	:	`aflow --proto=ABC3_tP10_100_b_a_bc --params=`$a, c/a, z_1, z_2, z_3, x_4, z_4$

- Ammonium Nitrate exists in a variety of forms, (Hermann, 1937) depending on the temperature:

Phase	Temperature °C	*Strukturbericht*	Page	
I	125 – 170	$G0_8$	AB_cP2_221_a_b.NH4.NO3	
II	84 – 125	$G0_9$	ABC3_tP10_100_b_a_bc	(this structure)
III	32 – 84	$G0_{10}$	ABC3_oP20_62_c_c_cd.N.NH4.O	
IV	-17 – 32	$G0_{11}$	A4B2C3_oP18_59_ef_ab_af	
V	< −17	Gwihabaite	A4B2C3_tP72_77_8d_ab2c2d_6d2	

- Data for this structure was taken at 60 °C.
- The positions of the hydrogen atoms were not determined. The isolated nitrogen atoms in this structure's visualization are surrounded by four hydrogen atoms in an approximately tetrahedral arrangement. It is likely that the NH_4 ions are free to rotate (Kracek, 1937).
- Both (Shinnaka, 1956) and (Hermann, 1937) state that the available x-ray diffraction data supports a space group of either *P*4*bm* (#100) or $P\bar{4}2_1m$ (#113). The atomic positions found by Shinnaka agree with space group *P*4*bm*.
- (Shinnaka, 1956) states that the NO_3 nitrate groups are rotating, but this rotation "is almost bound in two orientations (in opposite directions)." He then gives two possible orientations for the nitrate. We present the first orientation here. The second orientation is obtained by taking $z_3 \rightarrow -z_3$ and $z_4 \rightarrow -z_4$.
- Another way of presenting this information would be to add a second nitrate group to the primitive cell, and set the occupation of all the atoms in the nitrates at 50%. This would give a structure in space group $P4/mbm$ (#127), which

might be useful as a pictorial representation but does not correctly represent the physics of the crystal, as the nitrogen and oxygen atoms in an individual nitrate ion must remain together.

- The N–O distances in this structure are about 10% smaller than the distances found in the other phases of NH_4NO_3. This suggests that the structure should be reevaluated.
- The positions of the hydrogen atoms in the NH_4 ion were not determined, so we only provide the positions of the nitrogen atoms (labeled as NH_4).

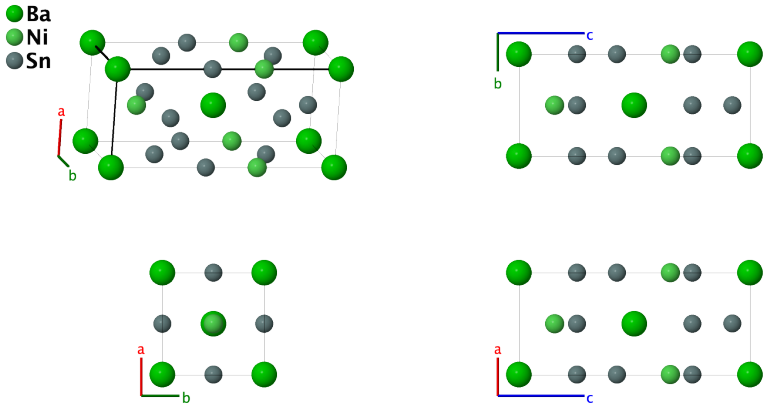
$BaNiSn_3$ Structure: ABC3_tI10_107_a_a_ab

http://aflow.org/prototype-encyclopedia/ABC3_tI10_107_a_a_ab



Prototype	:	$BaNiSn_3$
AFLOW prototype label	:	ABC3_tI10_107_a_a_ab
***Strukturbericht* designation**	:	None
Pearson symbol	:	tI10
Space group number	:	107
Space group symbol	:	*I*4*mm*
AFLOW prototype command	:	`aflow --proto=ABC3_tI10_107_a_a_ab --params=`$a, c/a, z_1, z_2, z_3, z_4$

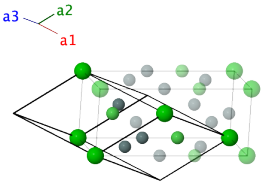
Other compounds with this structure

- $BaPdSn_3$, $CeCuAl_3$, $EuPdGe_3$, $LaOsSb_3$, $SrIrAl_3$, $SrNiSn_3$, $SrPdAl_3$, and $SrPtAl_3$

- This is a ternary form of the $D1_3$ ($BaAl_4$) structure. The atomic positions in both conventional cells are approximately the same, but the distribution of the atoms on those sites and the resulting relaxation leads to a different structure.
- Although (Dörrscheidt, 1978) give the structural information for $BaPtSn_3$ before that of $BaNiSn_3$, (Shatruk, 2019) and others list $BaNiSn_3$ as the prototype for this structure.
- Space group *I*4*mm* #107 does not specify the origin of the z-axis. (Dörrscheidt, 1978) places the barium atom at the origin.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} - \frac{1}{2}c\,\hat{\mathbf{z}}$$



Basis vectors:

Lattice Coordinates	Cartesian Coordinates	Wyckoff Position	Atom Type

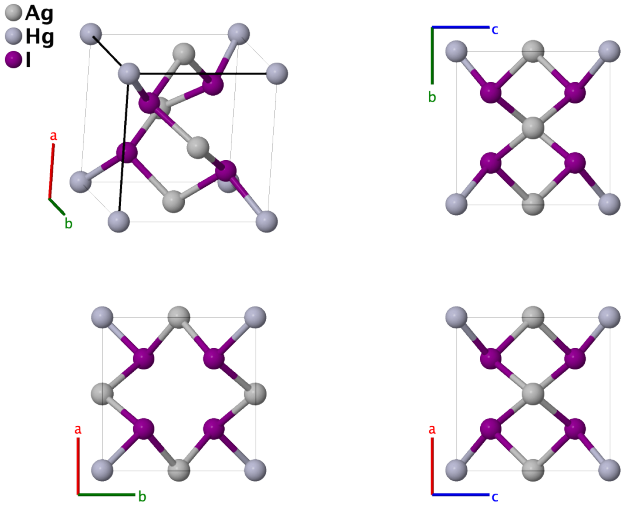
$E3_1$ (β-Ag_2HgI_4) (*obsolete*) Structure: A2BC4_tP7_111_f_a_n

http://aflow.org/prototype-encyclopedia/A2BC4_tP7_111_f_a_n



Prototype	:	Ag_2HgI_4
AFLOW prototype label	:	A2BC4_tP7_111_f_a_n
***Strukturbericht* designation**	:	$E3_1$
Pearson symbol	:	tP7
Space group number	:	111
Space group symbol	:	$P\bar{4}2m$
AFLOW prototype command	:	`aflow --proto=A2BC4_tP7_111_f_a_n --params=`$a, c/a, x_3, z_3$

- (Ketelaar, 1931) determined this pseudo-cubic structure for β-Ag_2HgI_4, and (Hermann, 1937) assigned it the *Strukturbericht* symbol $E3_1$. Later, (Browall, 1974) showed that β-Ag_2HgI_4 takes the Al_2CdS_4 structure, which some authorities give as *Strukturbericht* $E3$.

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

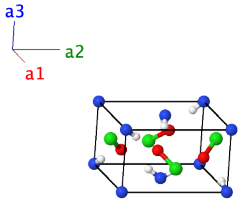
AFLOW prototype label	:	AB4CD2_tP16_113_c_f_a_e
***Strukturbericht* designation**	:	None
Pearson symbol	:	tP16
Space group number	:	113
Space group symbol	:	$P\bar{4}2_1m$
AFLOW prototype command	:	`aflow --proto=AB4CD2_tP16_113_c_f_a_e --params=`$a, c/a, z_2, x_3, z_3, x_4, y_4, z_4$

- This is the updated version of the $F5_4$ structure, including the positions of the hydrogen atoms.
- The data for this structure was taken at 150 K.
- Not to be confused with ammonium chlorate, NH_4ClO_3, which takes on the KNO_3 structure, or NH_4ClO_4, which has the $H0_5$ structure.

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

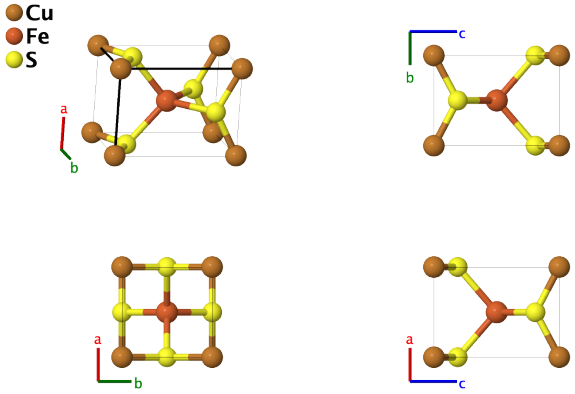
$F6_1$ (Chalcopyrite, $CuFeS_2$) (*obsolete*) Structure: ABC2_tP4_115_a_c_g

http://aflow.org/prototype-encyclopedia/ABC2_tP4_115_a_c_g

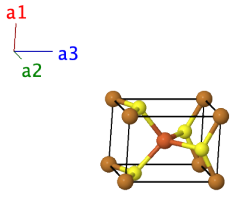


Prototype	:	$CuFeS_2$
AFLOW prototype label	:	ABC2_tP4_115_a_c_g
***Strukturbericht* designation**	:	$F6_1$
Pearson symbol	:	tP4
Space group number	:	115
Space group symbol	:	$P\bar{4}m2$
AFLOW prototype command	:	`aflow --proto=ABC2_tP4_115_a_c_g --params=`$a, c/a, z_3$

- This structure was presented as the chalcopyrite structure and given the *Strukturbericht* designation $F6_1$ in (Ewald, 1931). It was subsequently replaced with the $E1_1$ (ABC2_tI16_122_a_b_d) structure, which is now the accepted structure for chalcopyrite and similar compounds. We include the $F6_1$ structure as part of this historical record.

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	$(1a)$	Cu
$\mathbf{B}_2$	=	$\frac{1}{2}\,\mathbf{a}_1 + \frac{1}{2}\,\mathbf{a}_2 + \frac{1}{2}\,\mathbf{a}_3$	=	$\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$	$(1c)$	Fe
$\mathbf{B}_3$	=	$\frac{1}{2}\,\mathbf{a}_2 + z_3\,\mathbf{a}_3$	=	$\frac{1}{2}a\,\hat{\mathbf{y}} + z_3 c\,\hat{\mathbf{z}}$	$(2g)$	S
$\mathbf{B}_4$	=	$\frac{1}{2}\,\mathbf{a}_1 - z_3\,\mathbf{a}_3$	=	$\frac{1}{2}a\,\hat{\mathbf{x}} - z_3 c\,\hat{\mathbf{z}}$	$(2g)$	S

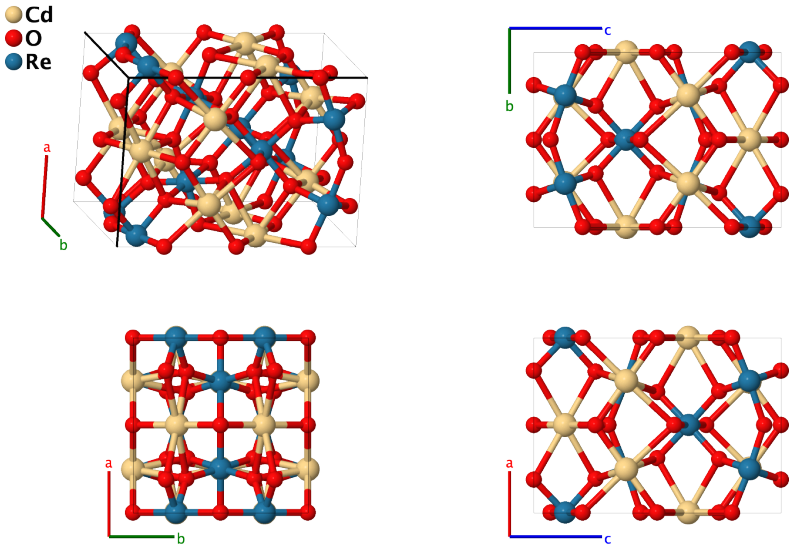
Phase II $Cd_2Re_2O_7$ Structure: A2B7C2_tI44_119_i_bdefgh_i

http://aflow.org/prototype-encyclopedia/A2B7C2_tI44_119_i_bdefgh_i



Prototype	:	$Cd_2O_7Re_2$
AFLOW prototype label	:	A2B7C2_tI44_119_i_bdefgh_i
***Strukturbericht* designation**	:	None
Pearson symbol	:	tI44
Space group number	:	119
Space group symbol	:	$I\bar{4}m2$
AFLOW prototype command	:	`aflow --proto=A2B7C2_tI44_119_i_bdefgh_i --params=`$a, c/a, z_3, z_4, x_5, x_6, x_7, z_7, x_8, z_8$

- $Cd_2Re_2O_7$ exhibits a number of phases. We will use the notation of (Kapcia, 2019) to describe them:
  - Phase I: above 200 K, the system takes on the cubic pyrochlore ($E8_1$) structure.
  - Phase II: in the range 120-200 K the system is in the tetragonal $I\bar{4}m2$ #119 structure (this structure).
  - Phase III: in the range 80-120 K the system is in the tetragonal $I4_122$ #98 structure.
  - Phase IV: (Kapcia, 2019) did a first-principles study of this system and found that below 80 K Phase III develops a soft phonon mode which transforms the system into an orthorhombic $F222$ #22 structure.
  - (Norman, 2019) points out that both Phase III and Phase IV structures have issues.
- Both Phase II and Phase III are extremely close to Phase I. If AFLOW-SYM allows a tolerance of 0.2 Å and FINDSYM allows a tolerance of 0.2 Å for both the lattice vectors and atomic positions both of the tetragonal phases become cubic.
- Phase IV is extremely close to Phase II. If AFLOW-SYM allows a tolerance of 0.002 Å and FINDSYM allows a tolerance 0.002 Å for both the lattice vectors and atomic positions the orthorhombic phase becomes tetragonal.
- Data for the Phase II structure was taken at 160 K.

Body-centered Tetragonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\end{aligned}$$

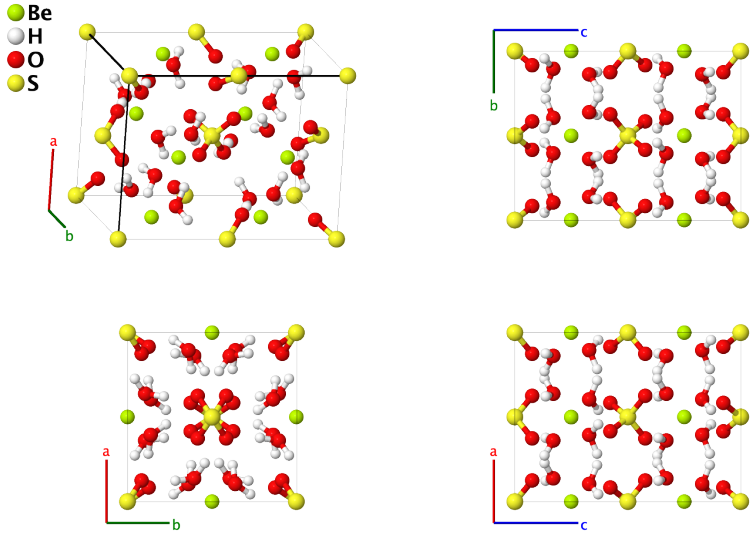
$BeSO_4{\cdot}4H_2O$ ($H4_3$) Structure: AB8C8D_tI72_120_c_2i_2i_b

http://aflow.org/prototype-encyclopedia/AB8C8D_tI72_120_c_2i_2i_b



Prototype	:	BeH_8O_8S
AFLOW prototype label	:	AB8C8D_tI72_120_c_2i_2i_b
***Strukturbericht* designation**	:	$H4_3$
Pearson symbol	:	tI72
Space group number	:	120
Space group symbol	:	$I\bar{4}c2$
AFLOW prototype command	:	`aflow --proto=AB8C8D_tI72_120_c_2i_2i_b --params=`$a, c/a, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

- The original determination of the $H4_3$ structure did not locate the positions of the hydrogen atoms. Since (Sikka, 1969) showed that the placement of the hydrogen atoms did not substantially affect the positions of the other atoms in the primitive cell, nor change the space group, we retain the original *Strukturbericht* designation for the improved structure.

Body-centered Tetragonal primitive vectors:

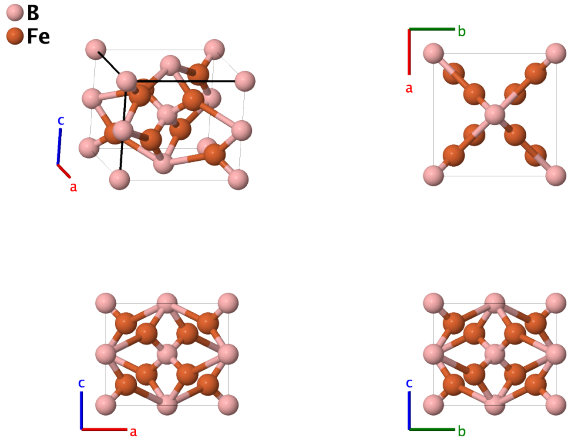
$C17$ (Fe_2B) (*obsolete*) Structure: AB2_tI12_121_ab_i

http://aflow.org/prototype-encyclopedia/AB2_tI12_121_ab_i



Prototype	:	BFe_2
AFLOW prototype label	:	AB2_tI12_121_ab_i
***Strukturbericht* designation**	:	$C17$
Pearson symbol	:	tI12
Space group number	:	121
Space group symbol	:	$I\bar{4}2m$
AFLOW prototype command	:	`aflow --proto=AB2_tI12_121_ab_i --params=`$a, c/a, x_3, z_3$

- (Wever, 1930) placed this structure in space group #121, and this was used to designate the structure as $C17$ in (Ewald, 1931). However, even then it was recognized that changing z_3 from the value of 0.2 assigned by Wever to 0.25 would add an inversion symmetry to the crystal, change the space group to "$I4/mcm$ #140", and make the structure look very much like Al_2Cu, *Strukturbericht* $C16$. This has become the accepted structure, as in (Kapfenberger, 2006), and so $C17$ is an obsolete designation. We retain it here for historical interest.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$

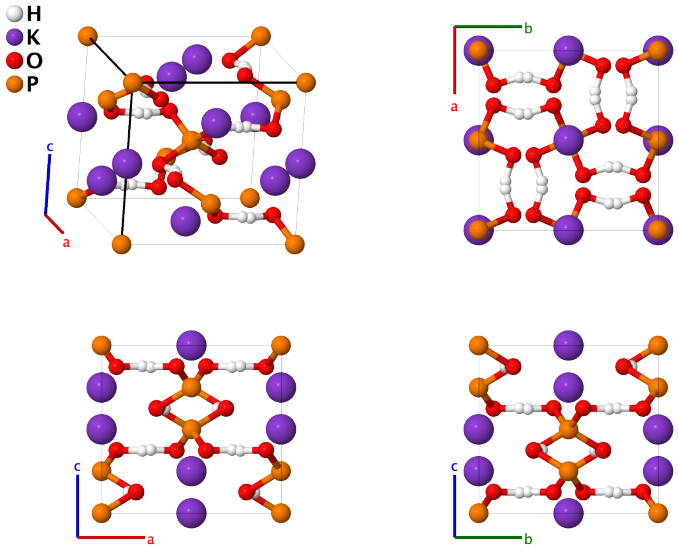
KH_2PO_4 ($H2_2$) Structure: A4BC4D_tI40_122_e_b_e_a

http://aflow.org/prototype-encyclopedia/A4BC4D_tI40_122_e_b_e_a



Prototype	:	H_2KO_4P
AFLOW prototype label	:	A4BC4D_tI40_122_e_b_e_a
***Strukturbericht* designation**	:	$H2_2$
Pearson symbol	:	tI40
Space group number	:	122
Space group symbol	:	$I\bar{4}2d$
AFLOW prototype command	:	`aflow --proto=A4BC4D_tI40_122_e_b_e_a --params=`$a, c/a, x_3, y_3, z_3, x_4, y_4, z_4$

Other compounds with this structure

- RbH_2PO_4, KH_2AsO_4, RbH_2AsO_4, CsH_2AsO_4, $NH_4H_2PO_4$, and $NH_4H_2AsO_4$

- The hydrogen ($16e$) sites are half-occupied. Given the closeness of pairs of hydrogen positions, presumably only one site in each pair is ever occupied.
- This partial occupancy gives a structure that differs slightly from the $H2_2$ structure described by (Ewald, 1928). There, the hydrogen atoms are at their averaged positions, Wyckoff position ($8d$).

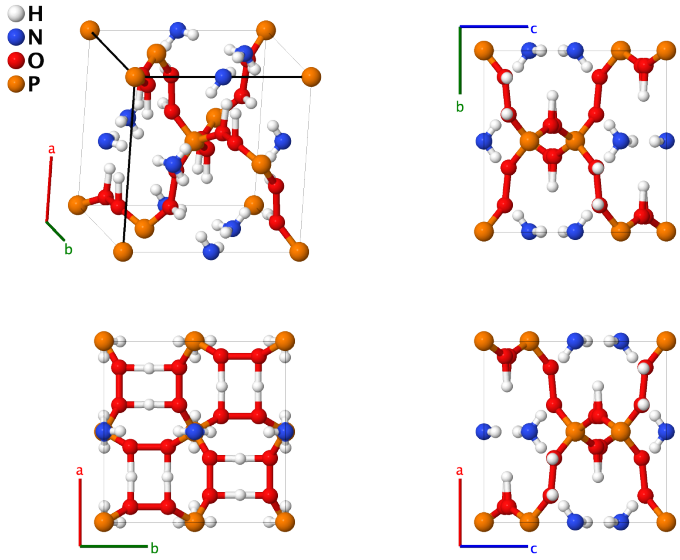
$NH_4H_2PO_4$ Structure: A8BC4D_tI56_122_2e_b_e_a

http://aflow.org/prototype-encyclopedia/A8BC4D_tI56_122_2e_b_e_a



Prototype	:	H_6NO_4P
AFLOW prototype label	:	A8BC4D_tI56_122_2e_b_e_a
***Strukturbericht* designation**	:	None
Pearson symbol	:	tI56
Space group number	:	122
Space group symbol	:	$I\bar{4}2d$
AFLOW prototype command	:	`aflow --proto=A8BC4D_tI56_122_2e_b_e_a --params=`$a, c/a, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5$

Other compounds with this structure

- $NH_4H_2AsO_4$

- $NH_4H_2PO_4$ and $NH_4H_2AsO_4$ are usually considered to be isomorphous with the $H2_2$ KH_2PO_4 structure, but (Khan, 1973) and (Fukami, 1987) were able to locate the hydrogen atoms in the NH_4 ion, so we include this as a new structure.
- As in KH_2PO_4, the H-I site, which is associated with the PO_4 ion, is 50% occupied.
- Below 148 K the H-I atoms become locked in place, and $NH_4H_2PO_4$ distorts in to a orthorhombic ferroelectric phase.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} - \frac{1}{2}c\,\hat{\mathbf{z}}$$

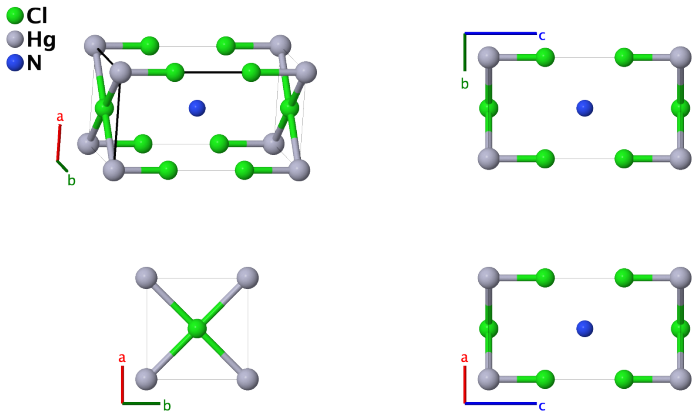
NH_4HgCl_3 ($E2_5$) Structure: A3BC_tP5_123_cg_a_d

http://aflow.org/prototype-encyclopedia/A3BC_tP5_123_cg_a_d

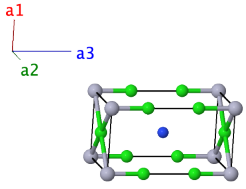


Prototype	:	$Cl_3Hg(NH_4)$
AFLOW prototype label	:	A3BC_tP5_123_cg_a_d
***Strukturbericht* designation**	:	$E2_5$
Pearson symbol	:	tP5
Space group number	:	123
Space group symbol	:	$P4/mmm$
AFLOW prototype command	:	`aflow --proto=A3BC_tP5_123_cg_a_d --params=`$a, c/a, z_4$

- The positions of the hydrogen atoms in the NH_4 ion are not given, so we only provide the nitrogen positions (labeled as NH_4). It is likely that the hydrogen atoms are freely rotating around the nitrogen, as any reasonable fixed positions would destroy both the inversion symmetry and the four-fold rotation axis exhibited by space group $P4/mmm$.
- (Harmsen, 1939) and (Herrmann, 1943) give multiple possible space groups for this structure. We have chosen the highest symmetry representation, space group $P4/mmm$ #123.

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	($1a$)	Hg

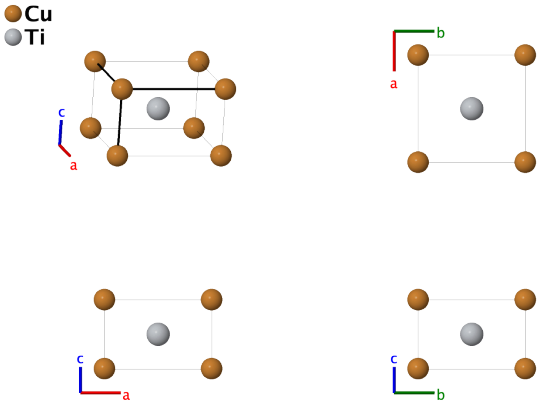
δ-CuTi ($L2_a$) Structure: AB_tP2_123_a_d

http://aflow.org/prototype-encyclopedia/AB_tP2_123_a_d.CuTi



Prototype	:	CuTi
AFLOW prototype label	:	AB_tP2_123_a_d
***Strukturbericht* designation**	:	$L2_a$
Pearson symbol	:	tP2
Space group number	:	123
Space group symbol	:	$P4/mmm$
AFLOW prototype command	:	`aflow --proto=AB_tP2_123_a_d --params=`$a, c/a$

Other compounds with this structure

- HgMn

- This structure has the same AFLOW designation, AB_tP2_123_a_d, as CuAu ($L1_0$). The only difference in the structures is the c/a ratio. $L1_0$ has $c/a \approx \sqrt{2}$, characteristitic of face-centered cubic ordering, while $L2_a$ has $c/a \approx 1$, a body-centered cubic-like system.

Simple Tetragonal primitive vectors:

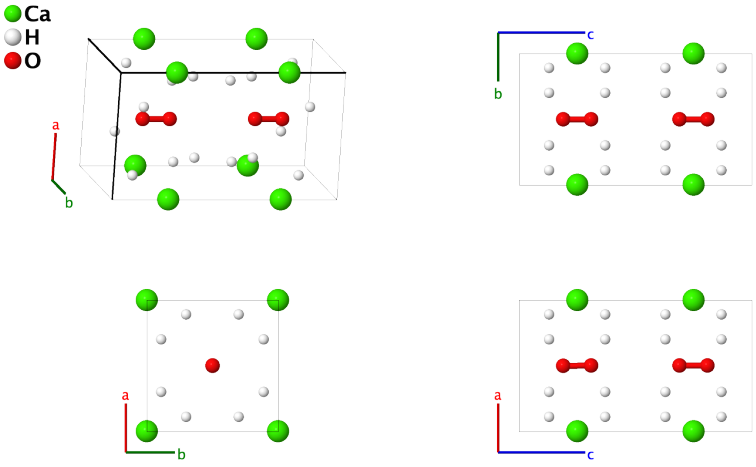
$CaO_2(H_2O)_8$ Structure: AB8C2_tP22_124_a_n_h

http://aflow.org/prototype-encyclopedia/AB8C2_tP22_124_a_n_h



Prototype	:	$Ca(H_2O)_8O_2$
AFLOW prototype label	:	AB8C2_tP22_124_a_n_h
***Strukturbericht* designation**	:	None
Pearson symbol	:	tP22
Space group number	:	124
Space group symbol	:	$P4/mcc$
AFLOW prototype command	:	`aflow --proto=AB8C2_tP22_124_a_n_h --params=`$a, c/a, z_2, x_3, y_3, z_3$

Other compounds with this structure

- $BrO_2(H_2O)_8$ and $SaO_2(H_2O)_8$

- This structure was proposed by (Shineman, 1951) to replace the $E6_2$ $SrO_2(H_2O)_8$ structure. The unit cell is doubled in the (001) direction, and the oxygens are now molecular.
- The positions of the hydrogen atom in the water molecule were not determined, so we only provide the oxygen position (labeled as H_2O).

- Vesuvianite, also known as idocrase, comes in a variety of compositions and structures, see *e.g.*, (Allen, 1992) and (Rucklidge, 1975) and references therein. For our example we use the original structure of (Warren, 1931), where the magnesium ($8f$) site is filled by a random (Mg,Fe) alloy. The positions of the hydrogen atoms in the OH ions were not determined, so we only give the positions of the oyxgen atoms (labeled as OH).

- The positions of the hydrogen atoms in the ammonia molecule are not determined, so we only provide the positions of the nitrogen atoms (labeled as NH_3).
- (Wells, 1936) gives the lattice coordinates in setting 1 of space group #126. We used FINDSYM to change this to the standard setting 2.

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

- (Onotaro, 1934) made the first determination of the structure of phosgenite, which was given *Strukturbericht* designation $G7_5$ by (Gottfried). (Giuseppetti, 1974) and others found that the actual structure has a unit cell twice that of $G7_5$. This newer structure is presented here.

- Although we use the structure found by (Chao, 1971), we should note that there is some disagreement between Chao's x-ray diffraction data and the neutron diffraction data taken by (Prince, 1971): while both agree on the positions of the heavy atoms, Prince's work suggests that some of the hydrogens may form OH radicals rather than water molecules.
- In any case, the fluorine atoms are usually partially replaced by OH radicals. This sample, which is predominantly fluorine, is technically labeled apophyllite-(KF).

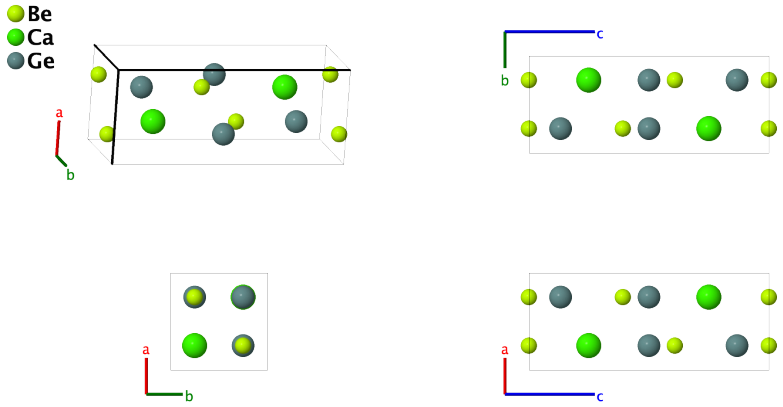
$CaBe_2Ge_2$ Structure: A2BC2_tP10_129_ac_c_bc

http://aflow.org/prototype-encyclopedia/A2BC2_tP10_129_ac_c_bc



Prototype	:	Be_2CaGe_2
AFLOW prototype label	:	A2BC2_tP10_129_ac_c_bc
***Strukturbericht* designation**	:	None
Pearson symbol	:	tP10
Space group number	:	129
Space group symbol	:	$P4/nmm$
AFLOW prototype command	:	`aflow --proto=A2BC2_tP10_129_ac_c_bc --params=`$a, c/a, z_3, z_4, z_5$

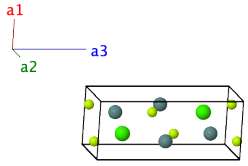
Other compounds with this structure

- $BaMg_2Pb_2$, $BaPd_2Sb_2$, $BaZn_2Sn_2$, $EuAu_2Al_2$, $EuPd_2Sb_2$, $EuPt_2Ge_2$, $LaPt_2Bi_2$, $LaPt_2Ge_2$, $LiPd_2Bi_2$, $SrPd_2Sb_2$, $SrPt_2As_2$, and $ThIr_2Si_2$

- This is a ternary form of the $D1_3$ ($BaAl_4$) structure. The atomic positions are approximately the same as in the conventional cell of $BaAl_4$, but the distribution of the atoms on those sites and the resulting relaxation leads to a different structure.
- Space group $P4/nmm$ #129 has two settings, but both have the same origin of the z-axis, so either setting will do here. We chose our standard setting 2 here.

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$



Basis vectors:

- Autunite $Ca(UO_2)_2(PO_4)_2{\cdot}nH_2O$, is found in three varieties: naturally occurring autunite, with $n \gtrsim 10$, and meta-autunite (I), which is partially dehydrated, $6 \gtrsim n \gtrsim 10$. Further dehydration in the laboratory produces meta-autunite (II).
- (Beintema, 1938) proposed a structure for meta-autunite (I), which (Herrmann, 1941) designated $H5_{10}$. He did not locate the calcium and oxygen atoms nor the water molecules. This structure was improved by (Makarov, 1960), and we include it here as our prototype for $H5_{10}$. The Ca-I site is 50% occupied, while the H_2O site is 75% occupied.
- The AFLOW label models the structure as if the sites were fully occupied.

Simple Tetragonal primitive vectors:

$$\mathbf{a}_1 = a\,\hat{\mathbf{x}}$$
$$\mathbf{a}_2 = a\,\hat{\mathbf{y}}$$
$$\mathbf{a}_3 = c\,\hat{\mathbf{z}}$$

- This determination of the crystal structure of $Sr(OH)_2(H_2O)_8$ improves upon the structure found by (Natta, 1928), which was given the *Strukturbericht* designation $E6_1$ by (Hermann, 1937). The new structure quadruples the size of the unit cell, locates the hydrogen atoms, and changes the space group.
- We use the data taken by (Ricci, 2005) at 20 K.

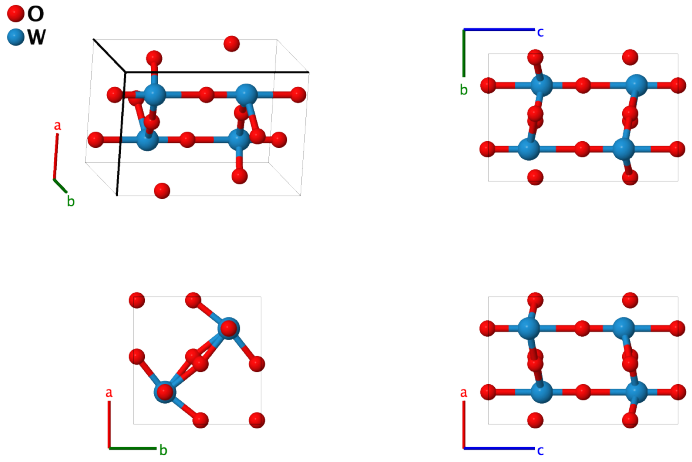
α-WO_3 Structure: A3B_tP16_130_cf_c

http://aflow.org/prototype-encyclopedia/A3B_tP16_130_cf_c



Prototype	:	O_3W
AFLOW prototype label	:	A3B_tP16_130_cf_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	tP16
Space group number	:	130
Space group symbol	:	$P4/ncc$
AFLOW prototype command	:	`aflow --proto=A3B_tP16_130_cf_c --params=`$a, c/a, z_1, z_2, x_3$

- All stable phases of WO_3 are distortions of the cubic α-ReO_3 ($D0_9$) phase. Based on (Woodward, 1997 and Vogt, 1999), the known stable phases and their approximate temperature ranges are:
  - α-WO_3 (1010-1170 K) (Vogt, 1999), this structure
  - β-WO_3 (600-1170 K) (Vogt, 1999)
  - γ-WO_3 (290-600 K) (Vogt, 1999)
  - δ-WO_3 (230-290 K) (Diehl, 1978)
  - ϵ-WO_3 (below 23 K) (Woodward, 1997)

  Woodward's caption says "The transition temperatures display large hysteresis effects and universal agreement is not found in the literature."
- In addition, several other structures have been proposed and/or found:
  - The original $D0_{10}$ structure (Bräkken, 1931), (Hermann, 1937) superseded by δ-WO_3
  - Original β-WO_3 (Salje, 1977)
  - Hexagonal WO_3 (Gerand, 1979) (metastable)

Simple Tetragonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= a\,\hat{\mathbf{x}}\\ \mathbf{a}_2 &= a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

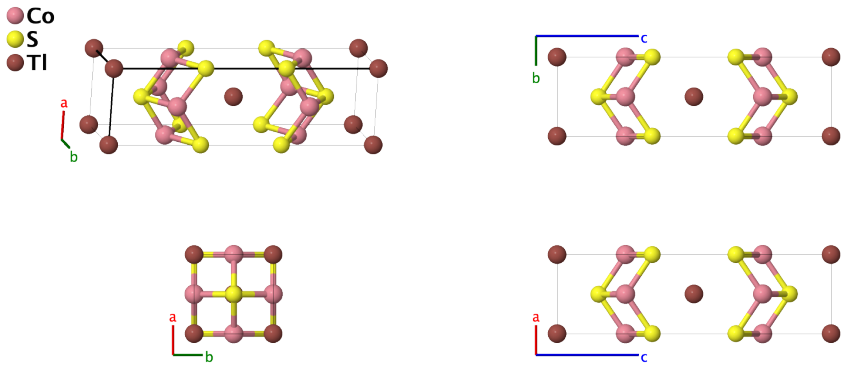
$TlCo_2S_2$ Structure: A2B2C_tI10_139_d_e_a

http://aflow.org/prototype-encyclopedia/A2B2C_tI10_139_d_e_a.TlCo2S2



Prototype	:	Co_2S_2Tl
AFLOW prototype label	:	A2B2C_tI10_139_d_e_a
***Strukturbericht* designation**	:	None
Pearson symbol	:	tI10
Space group number	:	139
Space group symbol	:	$I4/mmm$
AFLOW prototype command	:	`aflow --proto=A2B2C_tI10_139_d_e_a --params=`$a, c/a, z_3$

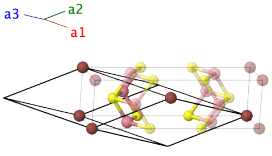
Other compounds with this structure

- $BaCr_2As_2$, $BaFe_2As_2$, BaP_2Zn_2, $BaSr_2As_2$, $BiCe_2O_2$, KCo_2Se_2, $TeCe_2O_2$, $TlCo_2Se_2$, $TlCu_2S_2$, $TlCu_2Se_2$, $TlCu_2Te_2$, $TlFe_2S_2$, $TlFe_2Se_2$, $TlNi_2S_2$, $TlNi_2Se_2$, and $Cl(Li_{0.25}Be_{0.75})_2O_2$

- This is a ternary form of the $D1_3$ ($BaAl_4$) structure. It differs from the $ThCr_2Si_2$ structure in that here $c/a > 3$.
- Other authors designate $TlCu_2Se_2$ or $Cl(Li_{0.25}Be_{0.75})_2O_2$ as the prototype for this structure, but (Klepp, 1978) give complete structural information for $TlCo_2S_2$, so we use that as the prototype.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} - \tfrac{1}{2}c\,\hat{\mathbf{z}}$$



Basis vectors:

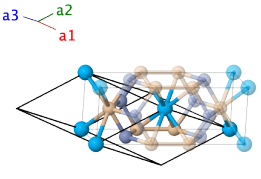
- (Shatruk, 2019) refers to this as "the perovskite of intermetallics." The list of compounds above is by no means complete.
- This is a ternary form of the $D1_3$ ($BaAl_4$) structure.
- The structures generally identified as having prototype $ThCr_2Si_2$ actually divide into two distinct regions, based on c/a ratio. We assign structures with $c/a \leq 3$ to the $ThCr_2Si_2$ structure, and those with $c/a > 3$ to the $TlCo_2S_2$ structure.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} - \frac{1}{2}c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	($2a$)	Th
$\mathbf{B}_2$	=	$\frac{3}{4}\,\mathbf{a}_1 + \frac{1}{4}\,\mathbf{a}_2 + \frac{1}{2}\,\mathbf{a}_3$	=	$\frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{4}c\,\hat{\mathbf{z}}$	($4d$)	Cr

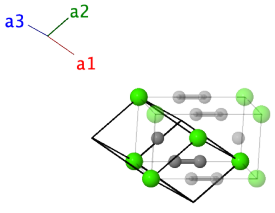
AFLOW prototype label	:	A2B_tI6_139_e_a
***Strukturbericht* designation**	:	$C11_a$
Pearson symbol	:	tI6
Space group number	:	139
Space group symbol	:	$I4/mmm$
AFLOW prototype command	:	`aflow --proto=A2B_tI6_139_e_a --params=`$a, c/a, z_2$

- (Ewald, 1931) designated both CaC_2 and $MoSi_2$ as *Strukturbericht* $C11$. (Smithells,1955) separated them into $C11_a$ (CaC_2) and $C11_b$ ($MoSi_2$, AB2_tI6_139_a_e).
- This is the stable room-temperature structure for CaC_2. There is also a meta-stable room temperature structure CaC_2-III (A2B_mC12_12_2i_i), and a low-temperature structure CaC_2, which has the ThC_2 (C_g) structure.
- (von Stackelberg, 1930) describes this structure in a face-centered-tetragonal setting. We follow (Smithells, 1955) and place it in the equivalent body-centered tetragonal setting.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} - \tfrac{1}{2}c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$0\,\mathbf{a}_1 + 0\,\mathbf{a}_2 + 0\,\mathbf{a}_3$	=	$0\,\hat{\mathbf{x}} + 0\,\hat{\mathbf{y}} + 0\,\hat{\mathbf{z}}$	$(2a)$	Ca
$\mathbf{B}_2$	=	$z_2\,\mathbf{a}_1 + z_2\,\mathbf{a}_2$	=	$z_2 c\,\hat{\mathbf{z}}$	$(4e)$	C
$\mathbf{B}_3$	=	$-z_2\,\mathbf{a}_1 - z_2\,\mathbf{a}_2$	=	$-z_2 c\,\hat{\mathbf{z}}$	$(4e)$	C

AFLOW prototype command	:	`aflow --proto=A8B_tI18_139_deh_a --params=`$a, c/a, z_3, x_4$

- (Jack, 1951) and others refer to this structure as α''-$Fe_{16}N_2$.
- (Yamashita, 2012) determined the structure by examining crystals containing various amounts of α''-$Fe_{16}N_2$ and α-Fe (bcc iron). We use their data from the sample that was 90% α''-$Fe_{16}N_2$. Their measurements were confirmed by first principles calculations, and are in agreement with the first principles calculations of (Sims, 2012).

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$

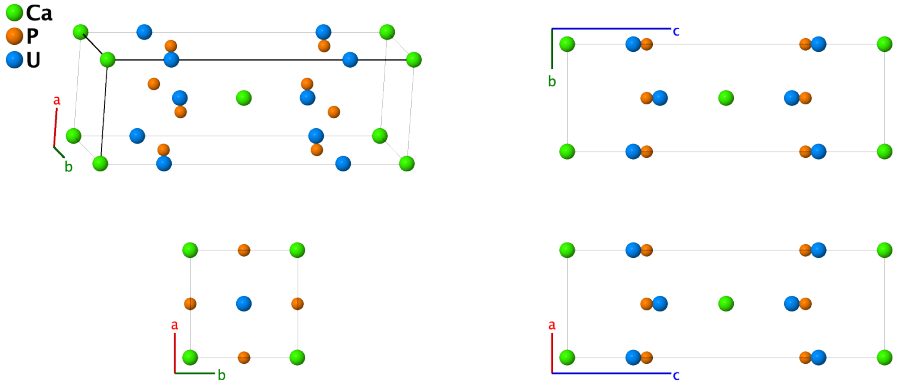
$H5_9$ [Autunite, $Ca(UO_2)_2(PO_4)_2{\cdot}10\frac{1}{2}H_2O$] (*obsolete*) Structure: AB2C2_tI10_139_a_d_e

http://aflow.org/prototype-encyclopedia/AB2C2_tI10_139_a_d_e



Prototype	:	$Ca(UO_2)_2(PO_4)_2{\cdot}10\frac{1}{2}H_2O$
AFLOW prototype label	:	AB2C2_tI10_139_a_d_e
***Strukturbericht* designation**	:	$H5_9$
Pearson symbol	:	tI10
Space group number	:	139
Space group symbol	:	$I4/mmm$
AFLOW prototype command	:	`aflow --proto=AB2C2_tI10_139_a_d_e --params=`$a, c/a, z_3$

- Autunite $Ca(UO_2)_2(PO_4)_2{\cdot}nH_2O$, is found in three varieties: naturally occurring Autunite, with $n \gtrsim 10$, and meta-autunite (I), which is partially dehydrated, $6 \gtrsim n \gtrsim 10$. Further dehydration in the laboratory produces meta-autunite (II).
- (Beintema, 1938) proposed this structure for autunite, which (Herrmann, 1941) designated $H5_9$. This original tetragonal structure did not locate the oxygen atoms or the water molecules. Later determinations of this structure (Locock, 2003) located all the atoms in the crystal for $n = 11$, and found the structure to be orthorhombic.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}a\,\hat{\mathbf{x}} - \tfrac{1}{2}a\,\hat{\mathbf{y}} + \tfrac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}a\,\hat{\mathbf{x}} + \tfrac{1}{2}a\,\hat{\mathbf{y}} - \tfrac{1}{2}c\,\hat{\mathbf{z}}$$

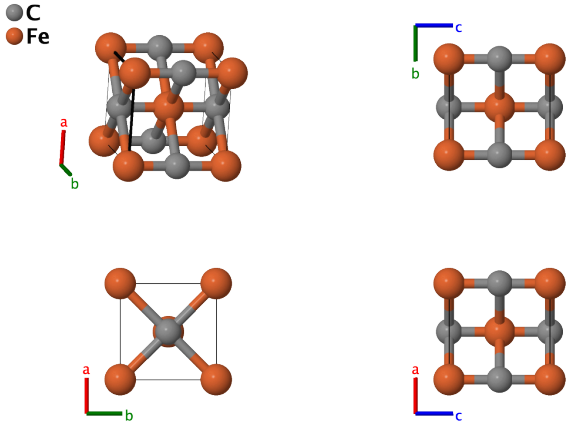
"Martensite Type" FeC_x ($x \leq 0.06$) ($L'2_0$) Structure: AB_tI4_139_b_a

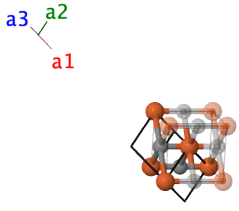
http://aflow.org/prototype-encyclopedia/AB_tI4_139_b_a



Prototype	:	C_xFe
AFLOW prototype label	:	AB_tI4_139_b_a
***Strukturbericht* designation**	:	$L'2_0$
Pearson symbol	:	tI4
Space group number	:	139
Space group symbol	:	$I4/mmm$
AFLOW prototype command	:	`aflow --proto=AB_tI4_139_b_a --params=`$a, c/a$

- This should *not* be considered a true model of martensite, a very complex material whose structure is sensitive to composition (Blackwell, 1996; Sherby, 2008). However, (Ewald, 1931) assign this the label $L'2_0$, saying that this structure is "α-Fe with 6 atomic percent C." Although Ewald and Hermann present a long discussion of martensite (pp. 489, 576-583), they do not give this exact crystal structure, which we take from (Brandes, 1992) and (Pearson, 1967).
- (Villars, 1995) and (Westbrook, 1995) ignore this structure and give the $L'2$ label to the ThH_2 structure. We previously followed this notation, but in the interest of historical accuracy will relabel that structure with the name given to it by (Brandes, 1992) and (Pearson, 1967), $L'2_b$.
- We should note that these last two references list the current structure simply as $L'2$.

Body-centered Tetragonal primitive vectors:



$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} - \frac{1}{2}c\,\hat{\mathbf{z}}$$

Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type

Other compounds with this structure

- KN_3 and CsN_3

- (Bozorth, 1923) originally determined the lattice constants of KHF_2 along with the positions of the potassium and fluorine atoms. He also assumed that the hydrogen atoms were on the (4*d*) Wyckoff sites. Both (Peterson, 1952) and (Ibers, 1964) confirmed his data. All three papers point out that it is possible that the hydrogen atoms are on half-filled (8*h*) sites, which would reduce to the (4*d*) site as the x coordinate approached zero. In KN_3 and CsN_3 the nitrogen atoms occupy the (4*d*) and (8*h*) Wyckoff sites, while the cation occupies the (4*a*) site.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$

AFLOW prototype label	:	A31B20_tI204_140_b2gh3m_ac2fh3l
***Strukturbericht* designation**	:	None
Pearson symbol	:	tI204
Space group number	:	140
Space group symbol	:	$I4/mcm$
AFLOW prototype command	:	`aflow --proto=A31B20_tI204_140_b2gh3m_ac2fh3l --params=`$a, c/a, z_4, z_5, z_6, z_7, x_8, x_9, x_{10}, z_{10}, x_{11}, z_{11}, x_{12}, z_{12}, x_{13}, y_{13}, z_{13}, x_{14}, y_{14}, z_{14}, x_{15}, y_{15}, z_{15}$

Other compounds with this structure

- $Pu_{31}Pt_{20}$ and $Ca_{31}Sn_{20}$

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}$$

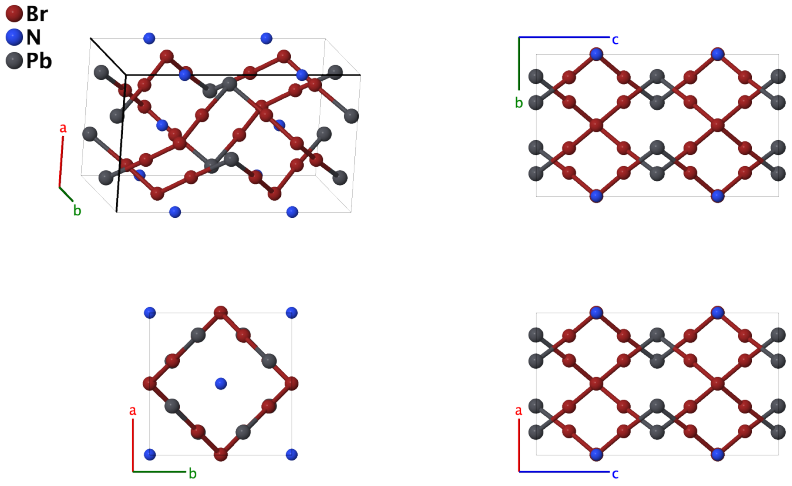
$NH_4Pb_2Br_5$ ($K3_4$) Structure: A5BC2_tI32_140_bl_a_h

http://aflow.org/prototype-encyclopedia/A5BC2_tI32_140_bl_a_h



Prototype	:	$Br_5(NH_4)Pb_2$
AFLOW prototype label	:	A5BC2_tI32_140_bl_a_h
***Strukturbericht* designation**	:	$K3_4$
Pearson symbol	:	tI32
Space group number	:	140
Space group symbol	:	$I4/mcm$
AFLOW prototype command	:	`aflow --proto=A5BC2_tI32_140_bl_a_h --params=`$a, c/a, x_3, x_4, z_4$

Other compounds with this structure

- KPb_2Br_5, $RbPb_2Br_5$, KSn_2Br_5, KSn_2I_5, $InSn_2Br_5$, $InSn_2I_5$, $CsSn_2Br_5$, $TlSn_2Br_5$, $RbSn_2Br_5$, $InPb_2I_5$, and ISe_2Tl_5

- The positions of the hydrogen atoms in the NH_4 ions were not determined, so we only provide the positions of the nitrogen atoms (labeled as NH_4).

Body-centered Tetragonal primitive vectors:

Prototype	:	Cl_5CoCs_3
AFLOW prototype label	:	A5BC3_tI36_140_cl_b_ah
***Strukturbericht* designation**	:	$K3_1$
Pearson symbol	:	tI36
Space group number	:	140
Space group symbol	:	$I4/mcm$
AFLOW prototype command	:	`aflow --proto=A5BC3_tI36_140_cl_b_ah --params=`$a, c/a, x_4, x_5, z_5$

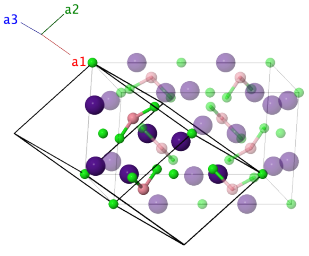
Other compounds with this structure

- Cs_3CoBr_5, $CsBa_5Ti_2Se_9Cl$, Rb_3ZnH_5, Cs_3ZnH_5, $(Sr_{3-x}A_x)AlO_4F$, (A = Ba, Ca), Ba_3MO_5, (M = tetravalent metal, and $M_3Mg(BH_4)_5$, (M = Rb, Cs)

- We show the structure using the data taken at 4.2 K.

Body-centered Tetragonal primitive vectors:

$$\mathbf{a}_1 = -\frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2}a\,\hat{\mathbf{y}} + \frac{1}{2}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = \frac{1}{2}a\,\hat{\mathbf{x}} + \frac{1}{2}a\,\hat{\mathbf{y}} - \frac{1}{2}c\,\hat{\mathbf{z}}$$



Basis vectors:

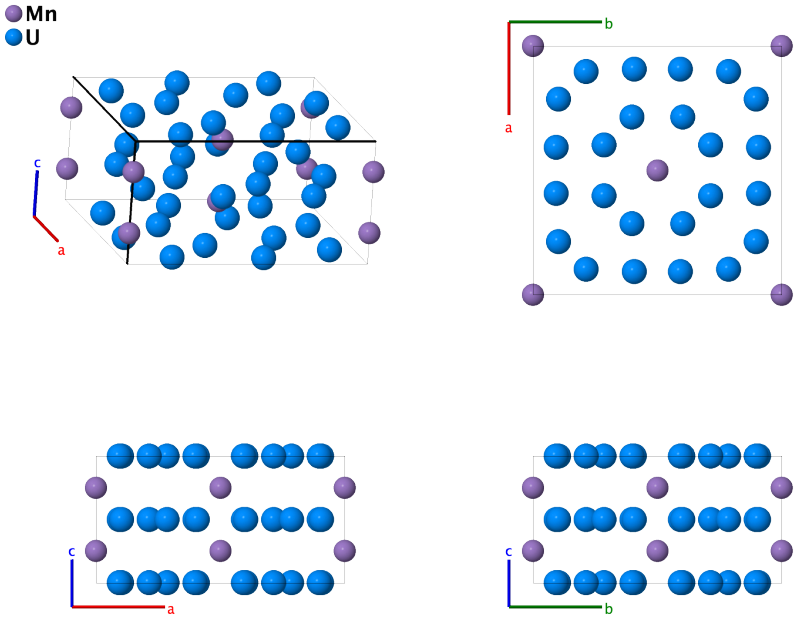
U_6Mn ($D2_c$) Structure: AB6_tI28_140_a_hk

http://aflow.org/prototype-encyclopedia/AB6_tI28_140_a_hk



Prototype	:	MnU_6
AFLOW prototype label	:	AB6_tI28_140_a_hk
***Strukturbericht* designation**	:	$D2_c$
Pearson symbol	:	tI28
Space group number	:	140
Space group symbol	:	$I4/mcm$
AFLOW prototype command	:	`aflow --proto=AB6_tI28_140_a_hk --params=`$a, c/a, x_2, x_3, y_3$

Other compounds with this structure

- U_6Co, U_6Fe, and U_6Ni

- This structure is closely related to the V_4SiSb_2 structure. This can also be identified as a defected version of the $D8_m$ W_5Si_3 structure.

Body-centered Tetragonal primitive vectors:

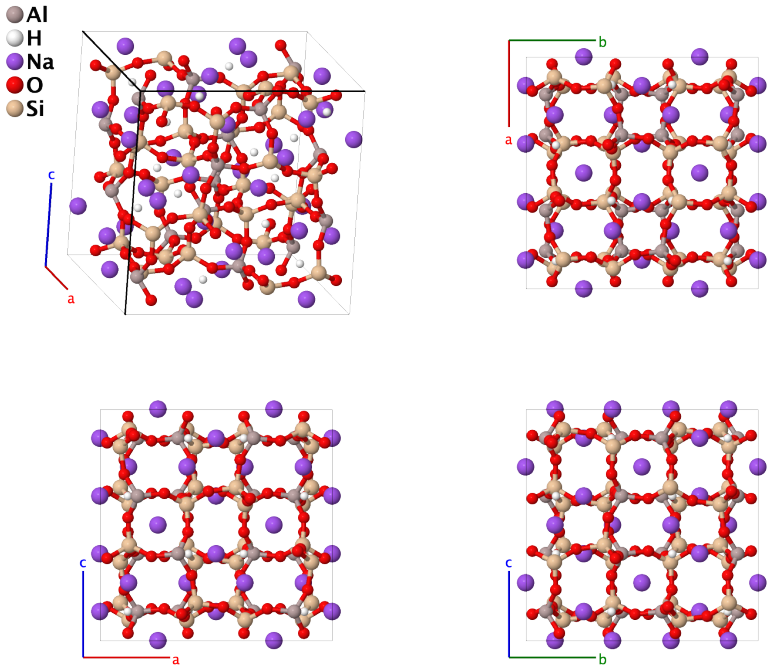
Analcime ($NaAlSi_2O_6 \cdot H_2O$, $S\,6_1$) Structure: A2B2C3D12E4_tI184_142_f_f_be_3g_g

http://aflow.org/prototype-encyclopedia/A2B2C3D12E4_tI184_142_f_f_be_3g_g



Prototype	:	$Al(H_2O)NaO_6Si_2$
AFLOW prototype label	:	A2B2C3D12E4_tI184_142_f_f_be_3g_g
***Strukturbericht* designation**	:	$S\,6_1$
Pearson symbol	:	tI184
Space group number	:	142
Space group symbol	:	$I4_1/acd$
AFLOW prototype command	:	`aflow --proto=A2B2C3D12E4_tI184_142_f_f_be_3g_g --params=`$a, c/a, x_2, x_3, x_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- Analcime is pseudo-cubic, space group $Ia\bar{3}d$ #230, but (Hartwig, 1931) showed that the structure actually is tetragonal, space group $I4_1/acd$ #142. (Hermann, 1937) listed both structures in defining *Strukturbericht* type $S\,6_1$.
- Analcime can have many crystal structures, as found in *e.g.,* (Mazzi, 1978) and (Pechar, 1988). We take our prototype from (Mazzi, 1978), using the data from their sample ANA 1, which is in space group $I4_1/acd$ #142. The major difference between this structure and that found by (Hartwig, 1931) is that sodium atoms were found at the (8*b*) Wyckoff position (Na-I). (Mazzi, 1978) recover the stoichiometry by noting that site Na-I (8*b*) is only occupied 23% of the time, while site Na-II (16*e*) has 82% occupancy. In addition, our Si site (32*g*) is actually 47% aluminum and 53% silicon, and the site which we, following (Hartwig, 1931), label Al (16*f*) is actually 98% silicon and only 2% aluminum. These fractions are highly dependent upon the choice of sample.
- Removing all sodium from the (8*b*) site results in the original structure found by (Hartwig, 1931) and defined as $S\,6_1$ by (Hermann, 1937).
- The positions of the hydrogen atoms in the water molecules were not determined, so we only provide the positions of the oxygen atoms (labeled as H_2O).

Body-centered Tetragonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2}\,a\,\hat{\mathbf{y}} + \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{1}{2}\,a\,\hat{\mathbf{y}} - \tfrac{1}{2}\,c\,\hat{\mathbf{z}}\end{aligned}$$

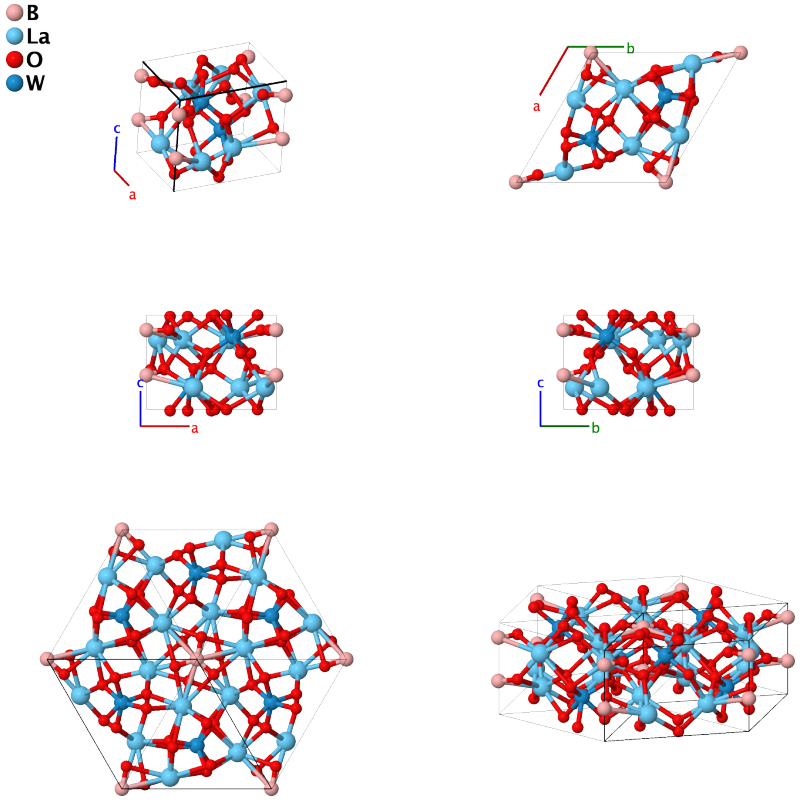
La_3BWO_9 ($P3$) Structure: AB3C9D_hP28_143_2a_2d_6d_bc

http://aflow.org/prototype-encyclopedia/AB3C9D_hP28_143_2a_2d_6d_bc



Prototype	:	BLa_3O_9W
AFLOW prototype label	:	AB3C9D_hP28_143_2a_2d_6d_bc
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP28
Space group number	:	143
Space group symbol	:	$P3$
AFLOW prototype command	:	`aflow --proto=AB3C9D_hP28_143_2a_2d_6d_bc --params=`$a, c/a, z_1, z_2, z_3, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}, x_{12}, y_{12}, z_{12}$

- Most refinements of the BLa_3O_9W structure, including (Ashtar, 2020) place it in hexagonal space group $P6_3$ #173. (Han, 2018) find a better fit to the data by refining it in the trigonal $P3$ #143 space group, which places the lanthanum atoms on two independent crystallographic sites. As this may be due to the presence of bismuth impurities, which (Han, 2018) place on the lanthanum site, while (Ashtar, 2020) claim to have very pure samples, we withhold judgment on which structure is correct and present both.
- Space group $P3$ does not specify the origin of the z-axis. Here it is set so that the coordinate of the ($1b$) tungsten atom is $z_3 = 1/4$.
- (Han, 2018) mislabel the Wyckoff positions of the boron and tungsten atoms. We show the correct positions based on

the coordinates in their table, and the correspondence with the $P6_3$ structure.

Other compounds with this structure

- $CsNO_3$ (II) and $TlNO_3$ (III)

- $RbNO_3$ takes on four distinct phases with increasing temperature (Shamsuzzoha, 1988). Phase IV, presented here, is the ground state, stable up to 437 K. Phase III, stable in the range 437-492 K, is in the cesium chloride ($B2$) structure, with rubidium atoms on the cesium sites and orientationally disordered NO_3 ions on the chlorine sites. Phase II, stable

up to 564 K, is possibly a body-centered cubic structure with up to eight formula units in the conventional unit cell. Phase I, stable up to the melting point, is thought to be a sodium chloride ($B1$) structure, with NO_3 again playing the role of chlorine.

- The Phase IV structure also exists in the enantiomorphic space group $P3_2$ #145. (Shamsuzzoha, 1982)
- We used the data taken at room temperature, 298 K.

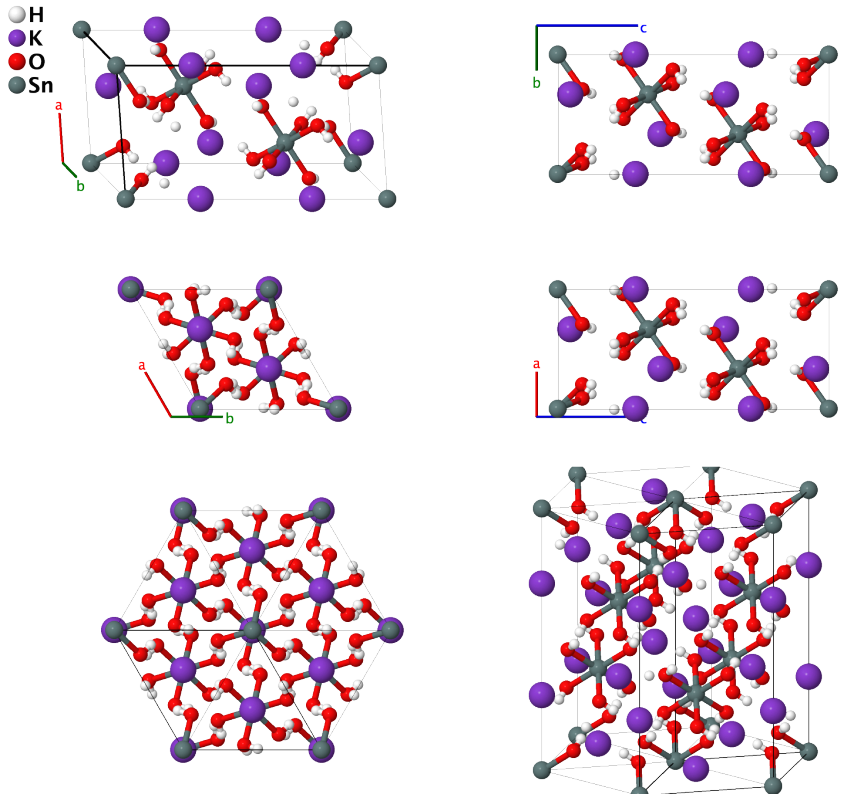
$K_2Sn(OH)_6$ ($H6_2$) Structure: A6B2C6D_hR15_148_f_c_f_a

http://aflow.org/prototype-encyclopedia/A6B2C6D_hR15_148_f_c_f_a



Prototype	:	$H_6K_2O_6Sn$
AFLOW prototype label	:	A6B2C6D_hR15_148_f_c_f_a
***Strukturbericht* designation**	:	$H6_2$
Pearson symbol	:	hR15
Space group number	:	148
Space group symbol	:	$R\bar{3}$
AFLOW prototype command	:	`aflow --proto=A6B2C6D_hR15_148_f_c_f_a [--hex] --params=`$a, c/a, x_2, x_3, y_3, z_3, x_4, y_4, z_4$

Other compounds with this structure

- $K_2Pt(OH)_6$ and $Na_2Sn(OH)_6$

- (Wyckoff, 1928) found the positions of the potassium and tin atoms in this structure. He could not locate the oxygen atoms, and so was unable to give an unequivocal determination of the space group, beyond noting that it was rhombohedral. We use the modern structure of (Jacobs, 2000), which agrees with Wyckoff in the positioning of the potassium and tin atoms, and finds both the hydrogen and oxygen locations.
- (Ewald, 1931) gave this the *Strukturbericht* designation $H6_2$. (Hermann, 1937) began relabeling the $H6$ structures as $I1$, and (Gottfried, 1937) relabeled them as $J1$, but neither they nor successor volumes revisited this structure, so it was never formally relabeled $J1_2$. We will therefore leave it as $H6_2$.

Rhombohedral primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\end{aligned}$$

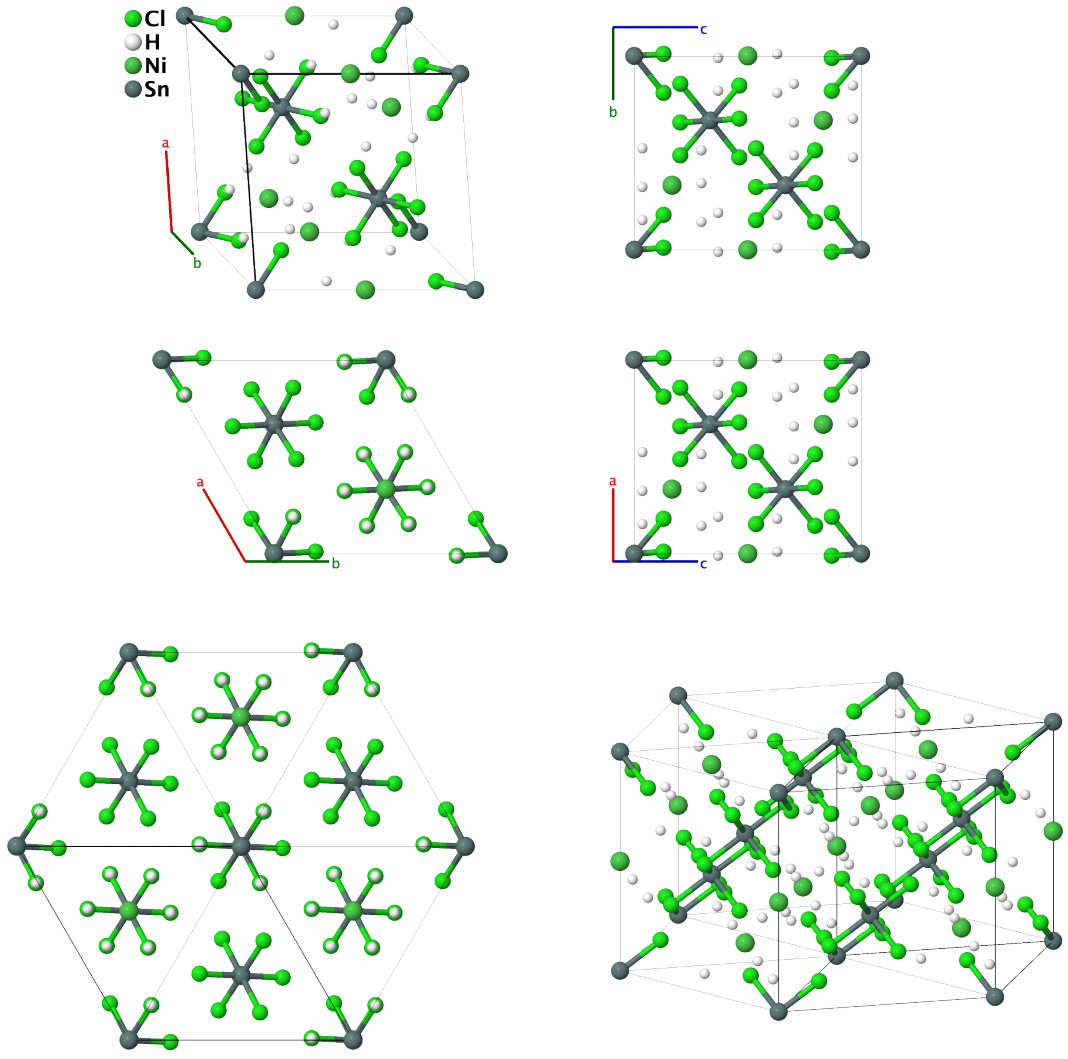
$Ni(H_2O)_6SnCl_6$ ($I6_1$) Structure: A6B6CD_hR14_148_f_f_b_a

http://aflow.org/prototype-encyclopedia/A6B6CD_hR14_148_f_f_b_a



Prototype	:	$Cl_6(H_2O)_6NiSn$
AFLOW prototype label	:	A6B6CD_hR14_148_f_f_b_a
***Strukturbericht* designation**	:	$I6_1$
Pearson symbol	:	hR14
Space group number	:	148
Space group symbol	:	$R\bar{3}$
AFLOW prototype command	:	`aflow --proto=A6B6CD_hR14_148_f_f_b_a [--hex] --params=`$a, c/a, x_3, y_3, z_3, x_4, y_4, z_4$

Other compounds with this structure

- $Ca(H_2O)_6SnF_6$, $Co(H_2O)_6PtF_6$, $Co(H_2O)_6SiF_6$, $Co(NH_3)_6Co(CN)_6$, $Fe(H_2O)_6SiF_6$, $Mg(H_2O)_6SiF_6$, $Mg(H_2O)_6SnF_6$, $Mg(H_2O)_6TiF_6$, $Mn(H_2O)_6SiF_6$, $Ni(H_2O)_6SiF_6$, $Zn(H_2O)_6SiF_6$, $Zn(H_2O)_6SnF_6$, $Zn(H_2O)_6TiF_6$, and $Zn(H_2O)_6ZrF_6$

- $Ni(H_2O)_6SnCl_6$ is the prototype for a large class of molecular crystals with the form MG_6LR_6, where MG_6 is a cation and LR_6 is an anion. (Hermann, 1937) gave this the *Strukturbericht* designation $I6_1$. (Gottfried, 1937) changed the I designations to J, so this should have become $J6_1$, but it was never referenced in any form in later volumes of *Strukturbericht*. Since $I6_1$ is the only designation for this structure in the literature, we use it rather than $J6_1$.
- The positions of the hydrogen atoms in the water molecules were not determined, so we only provide the positions of the oxygen atoms (labeled as H_2O).

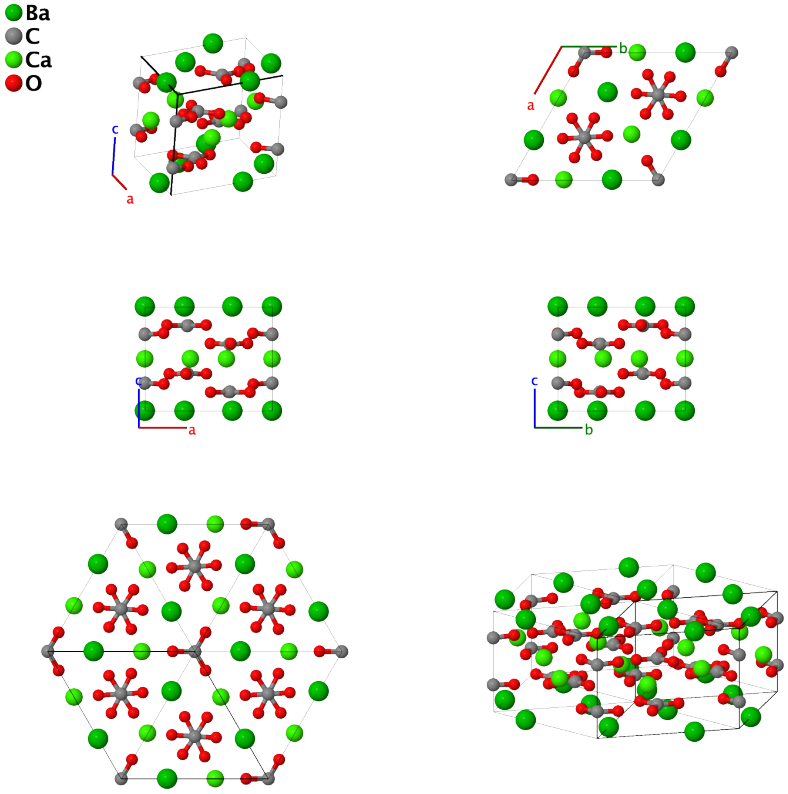
Paralstonite ($BaCa(CO_3)_2$) Structure: AB2CD6_hP30_150_e_c2d_f_3g

http://aflow.org/prototype-encyclopedia/AB2CD6_hP30_150_e_c2d_f_3g



Prototype	:	BaC_2CaO_6
AFLOW prototype label	:	AB2CD6_hP30_150_e_c2d_f_3g
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP30
Space group number	:	150
Space group symbol	:	$P321$
AFLOW prototype command	:	`aflow --proto=AB2CD6_hP30_150_e_c2d_f_3g --params=`$a, c/a, z_1, z_2, z_3, x_4, x_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8$

- $BaCa(CO_3)_2$ comes in a variety of crystal structures (Spahr, 2019):
  - monoclinic barytocalcite, space group $P2_1/m$ #11,
  - trigonal paralstonite, space group $P321$ #150 (the current structure),
  - triclinic alstonite, space group $P1$ #1 or $P\bar{1}$ #2 (Sartori, 1975), and
  - a new monoclinic structure, space group $C2$ #5, synthesized by (Spahr, 2019), and lacking the centrosymmetric character of barytocalcite.
- We were unable to obtain a copy of (Effenberger, 1980), so we use the data provided by (Downs, 2003).

Trigonal Hexagonal primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}\\ \mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}}\\ \mathbf{a}_3 &= c\,\hat{\mathbf{z}}\end{aligned}$$

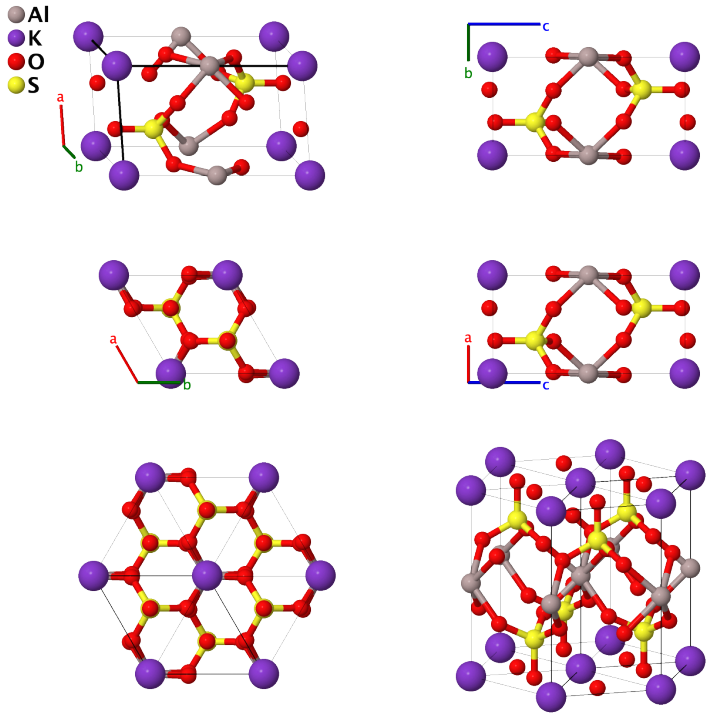
Steklite [$KAl(SO_4)_2$, $H3_2$] Structure: ABC8D2_hP12_150_b_a_dg_d

http://aflow.org/prototype-encyclopedia/ABC8D2_hP12_150_b_a_dg_d



Prototype	:	$AlKO_8S_2$
AFLOW prototype label	:	ABC8D2_hP12_150_b_a_dg_d
***Strukturbericht* designation**	:	$H3_2$
Pearson symbol	:	hP12
Space group number	:	150
Space group symbol	:	$P321$
AFLOW prototype command	:	`aflow --proto=ABC8D2_hP12_150_b_a_dg_d --params=`$a, c/a, z_3, z_4, x_5, y_5, z_5$

Other compounds with this structure

- $NH_4(Al,Fe)(SO_4)_2$ (godovikovite), $KCr(SO_4)_2$, and $RbCr(SO_4)_2$

- This has been a rather difficult structure to follow through the literature. (Villars, 2016) quotes the structure given by (Manoli, 1970), but gives the space group as $P\bar{3}$ #147. (Murashko, 2013) lists the space group as both $P312$ #149 and $P321$ #150, as well as listing obviously incorrect Wyckoff positions.
- (West, 2008) states that the simple structure is in $P\bar{3}$ but that it may be doubled along the c axis and be in space group $P321$.
- After correcting Murashko's results, we find that all of these interpretations yield essentially the same structure in a given layer, and only differ as the structure is reflected through the $z = 0$ plane. As it is not clear which structure is correct, we will use the original $H3_2$ structure given by (Hermann, 1937).

- Steklite is the name of the mineral form of this compound (Murashko, 2013). (Hermann, 1937) simply calls it *Wasserfreier Alaun* (anhydrous alum). For hydrated alum, $KAl(SO_4)_2 \cdot 12H_2O$, see the $H4_{13}$ structure.

Trigonal Hexagonal primitive vectors:

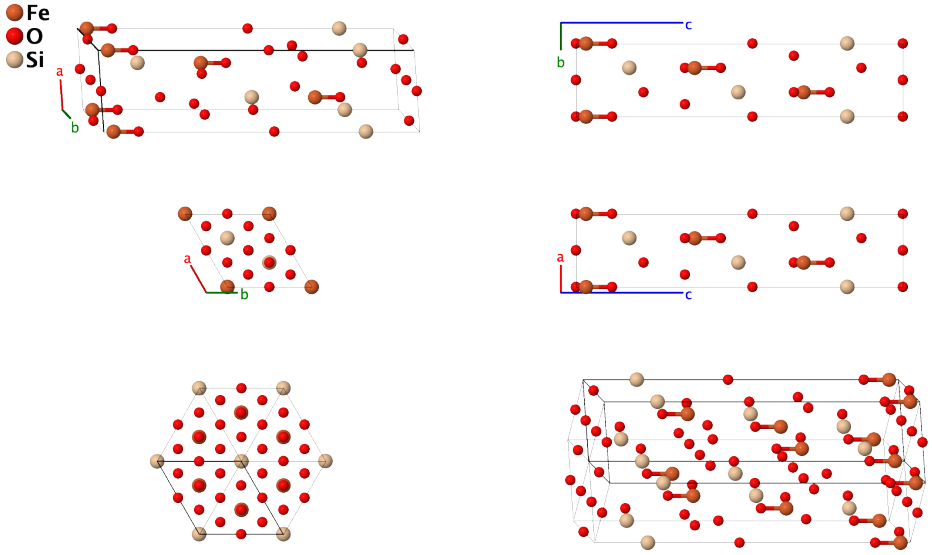
Cronstedtite {Fe(Fe,Si)[(OH)$_2$,O]O$_3$, $S5_7$} Structure: AB3C2D_hR7_160_a_b_2a_a

http://aflow.org/prototype-encyclopedia/AB3C2D_hR7_160_a_b_2a_a

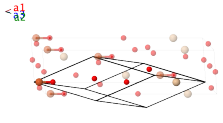


Prototype	:	$FeO_3(OH)_2Si$
AFLOW prototype label	:	AB3C2D_hR7_160_a_b_2a_a
***Strukturbericht* designation**	:	$S5_7$
Pearson symbol	:	hR7
Space group number	:	160
Space group symbol	:	$R3m$
AFLOW prototype command	:	`aflow --proto=AB3C2D_hR7_160_a_b_2a_a [--hex] --params=`$a, c/a, x_1, x_2, x_3, x_4, x_5, z_5$

- This particular structure of cronstedtite (also spelled cronstedite) is technically cronstedtite-3R, as there are three layers in the hexagonal cell, repeated in rhombohedral order. It is characterized by a high degree of disorder. The site we have labeled Si is better written as (Si,Fe), and the site labeled OH-I is actually [(OH)$_2$,O]. In addition the pure iron site, Fe ($1a$), is only occupied 90% of the time.
- As noted by (Frondel, 1962), there are a large number of varieties of cronstedtite, with each type having a different stacking sequence in the hexagonal cell.
- (Sterling, 1939) and (Hermann, 1943) put this structure in space group $R3$ #146, but the coordinates given by Sterling resolve to space group $R3m$ #160, and so we list this structure there.
- This is the final structure given a *Strukturbericht* designation.

Rhombohedral primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = -\frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$



Basis vectors:

		Lattice Coordinates		Cartesian Coordinates	Wyckoff Position	Atom Type
$\mathbf{B}_1$	=	$x_1\,\mathbf{a}_1 + x_1\,\mathbf{a}_2 + x_1\,\mathbf{a}_3$	=	$x_1 c\,\hat{\mathbf{z}}$	$(1a)$	Fe
$\mathbf{B}_2$	=	$x_2\,\mathbf{a}_1 + x_2\,\mathbf{a}_2 + x_2\,\mathbf{a}_3$	=	$x_2 c\,\hat{\mathbf{z}}$	$(1a)$	OH I
$\mathbf{B}_3$	=	$x_3\,\mathbf{a}_1 + x_3\,\mathbf{a}_2 + x_3\,\mathbf{a}_3$	=	$x_3 c\,\hat{\mathbf{z}}$	$(1a)$	OH II
$\mathbf{B}_4$	=	$x_4\,\mathbf{a}_1 + x_4\,\mathbf{a}_2 + x_4\,\mathbf{a}_3$	=	$x_4 c\,\hat{\mathbf{z}}$	$(1a)$	Si
$\mathbf{B}_5$	=	$x_5\,\mathbf{a}_1 + x_5\,\mathbf{a}_2 + z_5\,\mathbf{a}_3$	=	$\frac{1}{2}\,(x_5 - z_5)\,a\,\hat{\mathbf{x}} + \frac{1}{2\sqrt{3}}\,(x_5 - z_5)\,a\,\hat{\mathbf{y}} + \left(\frac{2}{3}x_5 + \frac{1}{3}z_5\right) c\,\hat{\mathbf{z}}$	$(3b)$	O
$\mathbf{B}_6$	=	$z_5\,\mathbf{a}_1 + x_5\,\mathbf{a}_2 + x_5\,\mathbf{a}_3$	=	$\frac{1}{2}\,(-x_5 + z_5)\,a\,\hat{\mathbf{x}} + \frac{1}{2\sqrt{3}}\,(x_5 - z_5)\,a\,\hat{\mathbf{y}} + \left(\frac{2}{3}x_5 + \frac{1}{3}z_5\right) c\,\hat{\mathbf{z}}$	$(3b)$	O
$\mathbf{B}_7$	=	$x_5\,\mathbf{a}_1 + z_5\,\mathbf{a}_2 + x_5\,\mathbf{a}_3$	=	$\frac{1}{\sqrt{3}}\,(-x_5 + z_5)\,a\,\hat{\mathbf{y}} + \left(\frac{2}{3}x_5 + \frac{1}{3}z_5\right) c\,\hat{\mathbf{z}}$	$(3b)$	O

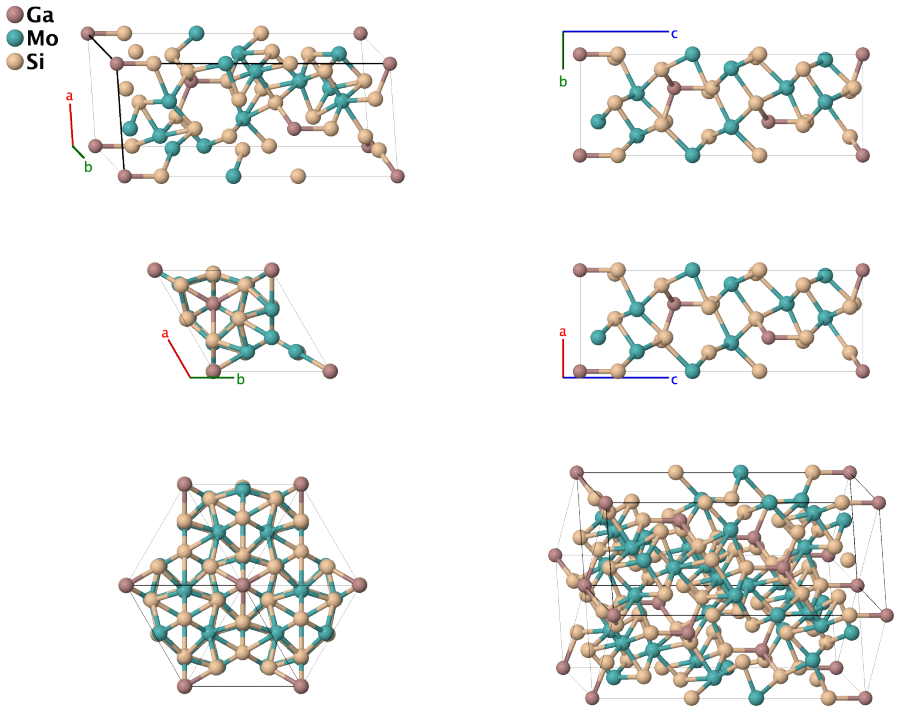
Low-Temperature $GaMo_4S_8$ Structure: AB4C8_hR13_160_a_ab_2a2b

http://aflow.org/prototype-encyclopedia/AB4C8_hR13_160_a_ab_2a2b



Prototype	:	$GaMo_4S_8$
AFLOW prototype label	:	AB4C8_hR13_160_a_ab_2a2b
***Strukturbericht* designation**	:	None
Pearson symbol	:	hR13
Space group number	:	160
Space group symbol	:	*R*3*m*
AFLOW prototype command	:	`aflow --proto=AB4C8_hR13_160_a_ab_2a2b [--hex] --params=`$a, c/a, x_1, x_2, x_3, x_4, x_5, z_5, x_6, z_6, x_7, z_7$

- At temperatures below 45 K $GaMo_4S_8$ transforms from its high-temperature cubic structure to this rhombohedral structure.
- We use the data from (François, 1991) at 8 K.
- Space group *R*3*m* #160 allows an arbitrary choice of the zero of the z-axis. Here we chose to place the gallium atom at the origin ($z_1 = 0$).

Rhombohedral primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\end{aligned}$$

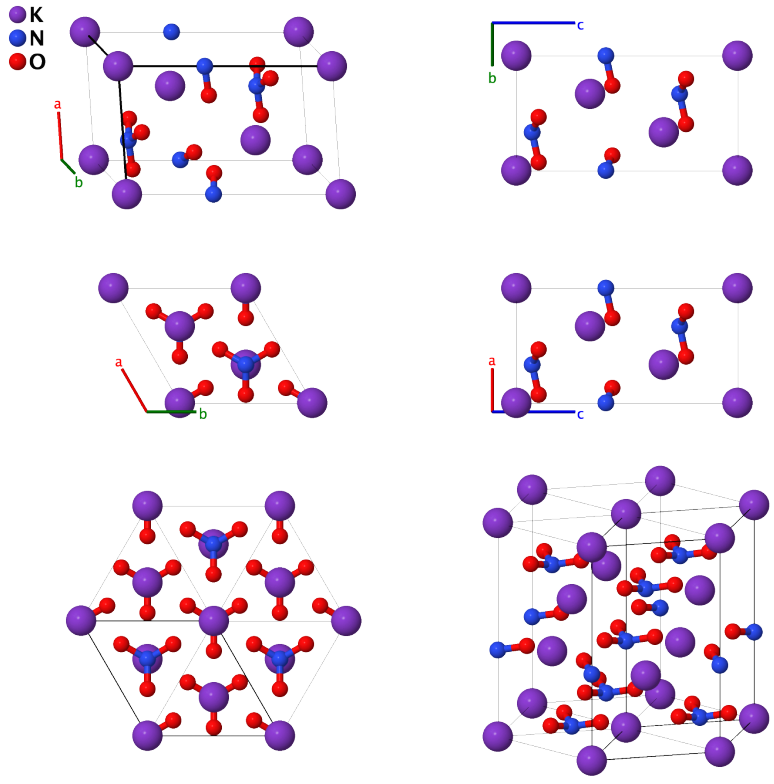
γ-Potassium Nitrate (KNO_3) Structure: ABC3_hR5_160_a_a_b

http://aflow.org/prototype-encyclopedia/ABC3_hR5_160_a_a_b



Prototype	:	KNO_3
AFLOW prototype label	:	ABC3_hR5_160_a_a_b
***Strukturbericht* designation**	:	None
Pearson symbol	:	hR5
Space group number	:	160
Space group symbol	:	$R3m$
AFLOW prototype command	:	`aflow --proto=ABC3_hR5_160_a_a_b [--hex] --params=`$a, c/a, x_1, x_2, x_3, z_3$

Other compounds with this structure

- NH_4ClO_4

- On heating, α-KNO_3 (either Structure I or Structure II) transforms into β-KNO_3 at 128 °C. When heated above 200 °C and then cooled, the β-phase transforms into the metastable ferroelectric γ-KNO_3 phase, which can remain down to room temperature.
- (Nimmo, 1976) give the data for γ-KNO_3 taken at 91 °C.
- Although this is isostructural with the $KBrO_3$ ($G0_7$) structure, we have included it here to facilitate the comparison of the various KNO_3 phases. γ-KNO_3 and $KBrO_3$ ($G0_7$) have the same AFLOW prototype label, ABC3_hR5_160_a_a_b. They are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.

Rhombohedral primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \frac{1}{3}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{\sqrt{3}}\,a\,\hat{\mathbf{y}} + \frac{1}{3}\,c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = -\frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \frac{1}{3}\,c\,\hat{\mathbf{z}}$$

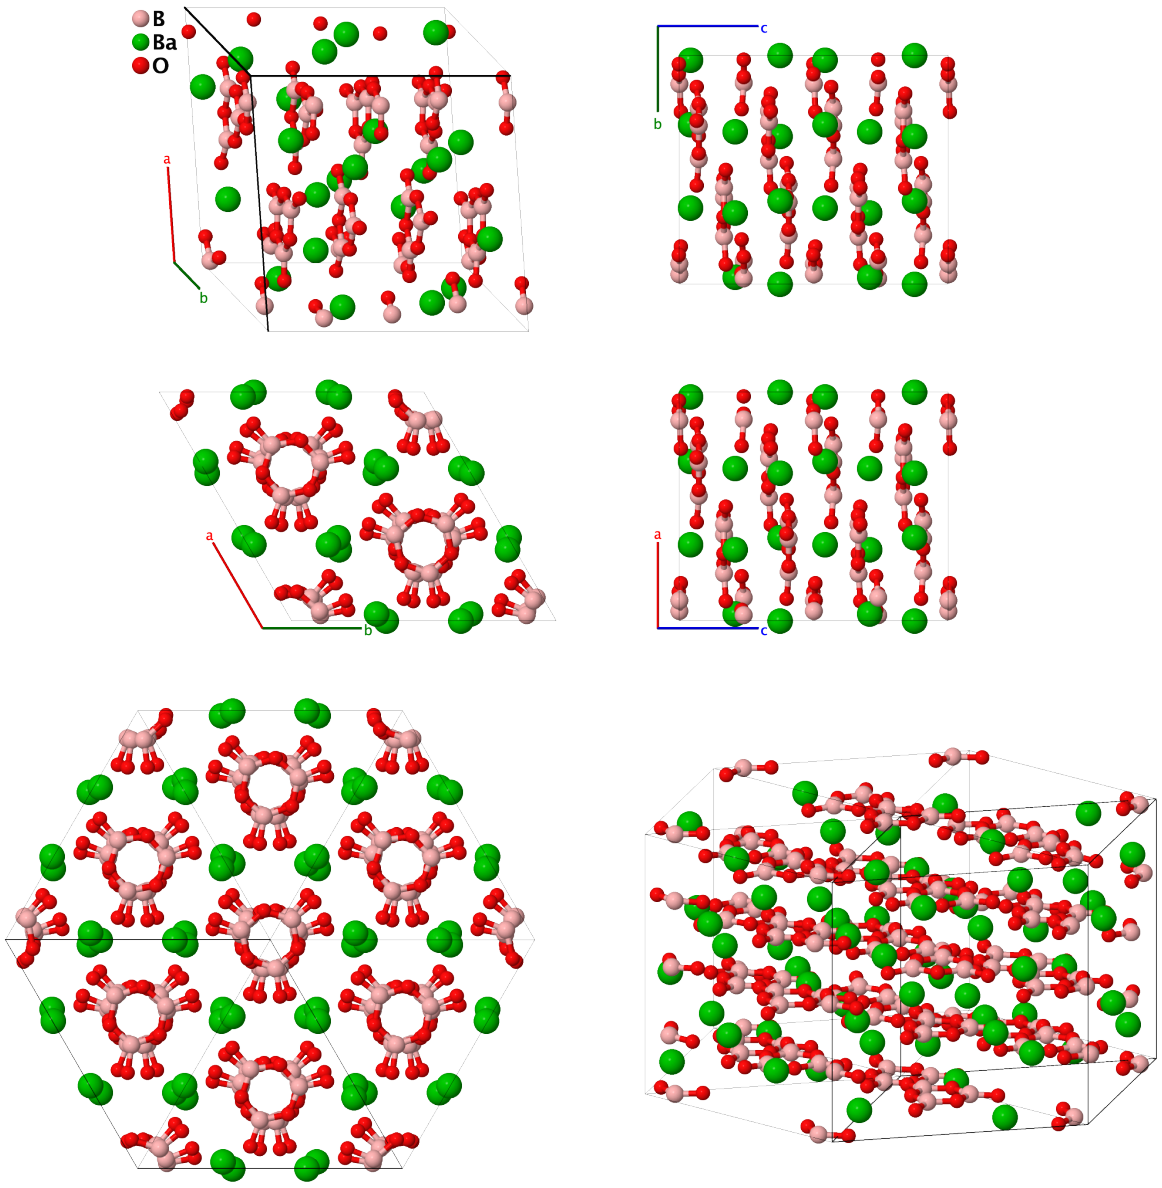
α-BaB_2O_4 (Low-Temperature) Structure: A2BC4_hR42_161_2b_b_4b

http://aflow.org/prototype-encyclopedia/A2BC4_hR42_161_2b_b_4b



Prototype	:	B_2BaO_4
AFLOW prototype label	:	A2BC4_hR42_161_2b_b_4b
***Strukturbericht* designation**	:	None
Pearson symbol	:	hR42
Space group number	:	161
Space group symbol	:	$R3c$
AFLOW prototype command	:	`aflow --proto=A2BC4_hR42_161_2b_b_4b [--hex] --params=`$a, c/a, x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7$

- This is the low-temperature structure. Heating to temperatures between 100-400 °C transforms it into β-BaB_2O_4. The principle difference between the two forms is the lack of inversion symmetry in the low-temperature structure.

Rhombohedral primitive vectors:

$$\begin{aligned}
\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}} \\
\mathbf{a}_2 &= \tfrac{1}{\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}} \\
\mathbf{a}_3 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}
\end{aligned}$$

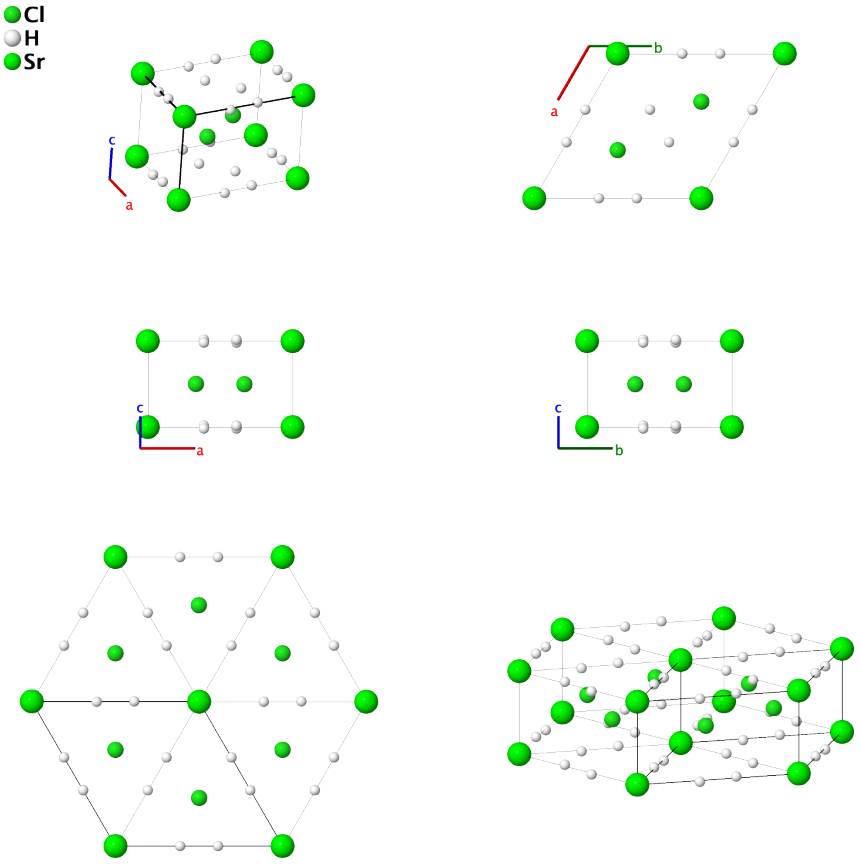
$I1_3$ ($SrCl_2{\cdot}(H_2O)_6$) (*obsolete*) Structure: A2B6C_hP9_162_d_k_a

http://aflow.org/prototype-encyclopedia/A2B6C_hP9_162_d_k_a



Prototype	:	$Cl_2(H_2O)_6Sr$
AFLOW prototype label	:	A2B6C_hP9_162_d_k_a
***Strukturbericht* designation**	:	$I1_3$
Pearson symbol	:	hP9
Space group number	:	162
Space group symbol	:	$P\bar{3}1m$
AFLOW prototype command	:	`aflow --proto=A2B6C_hP9_162_d_k_a --params=`$a, c/a, x_3, z_3$

Other compounds with this structure

- $CaCl_2 \cdot (H_2O)_6$, $CaBr_2 \cdot (H_2O)_6$, $SrBr_2 \cdot (H_2O)_6$, $CaI_2 \cdot (H_2O)_6$, $SrI_2 \cdot (H_2O)_6$, and $BaI_2 \cdot (H_2O)_6$

- (Hermann, 1937) gives this the *Strukturbericht* designation $I1_3$, but gives the prototype as $K_2Pt(SCN)_6$. As we discussed on the $K_2Pt(SCN)_6$ ($H6_3$) page, the difference between these two structures is significant, so we will use the original $H6_3$ designation for $K_2Pt(SCN)_6$, and $I1_3$ for $SrCl_2 \cdot (H_2O)_6$.
- In any case, (Aagon, 1986) and others have shown that the correct space group of this structure is $P321$ #150. We discuss the corrected structure on the $SrCl_2 \cdot (H_2O)_6$ page.

- Using the notation of (Gottfried, 1937) this could also be designated the $J1_3$ structure. That designation was never used in any *Strukturbericht* volume, so we will use $I1_3$ here.
- The positions of the hydrogen atoms in the water molecules were not determined, so we only provide the positions of the oxygen atoms (labeled as H_2O).

Trigonal Hexagonal primitive vectors:

- The (12*i*) site, which we show as occupied by fluorine, is actually occupied by a random mixture of fluorine atoms (67%) and OH radicals (33%).
- Although the replacement of fluorine by OH does not affect the shape of the Sb-$(F,OH)_6$ ions, it has a profound effect on the structure, as can be seen by looking at $NaSbF_6$ and $NaSb(OH)_6$ ($J1_{11}$).

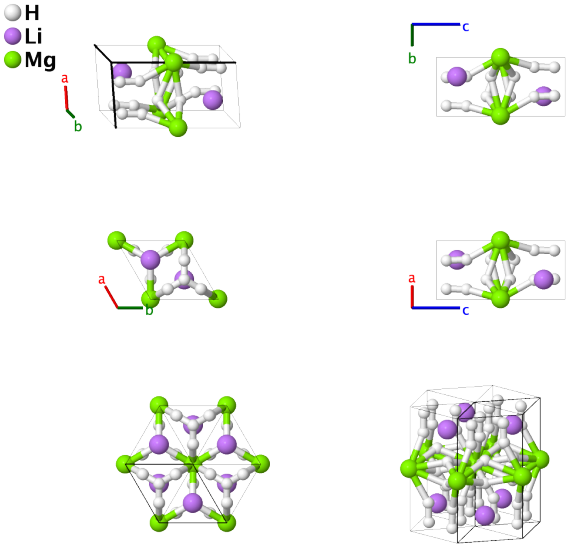
Predicted Li_2MgH_{16} 300 GPa Structure: A16B2C_hP19_164_2d2i_d_b

http://aflow.org/prototype-encyclopedia/A16B2C_hP19_164_2d2i_d_b



Prototype	:	$H_{16}Li_2Mg$
AFLOW prototype label	:	A16B2C_hP19_164_2d2i_d_b
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP19
Space group number	:	164
Space group symbol	:	$P\bar{3}m1$
AFLOW prototype command	:	`aflow --proto=A16B2C_hP19_164_2d2i_d_b --params=`$a, c/a, z_2, z_3, z_4, x_5, z_5, x_6, z_6$

- This structure is predicted to be the zero-temperature ground state of Li_2MgH_{16} at 300 GPa. It is primarily of interest because a metastable cubic structure with the same composition is predicted to be superconducting at 250 GPa with $T_c = 430 - 473$ K.

Trigonal Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}$$

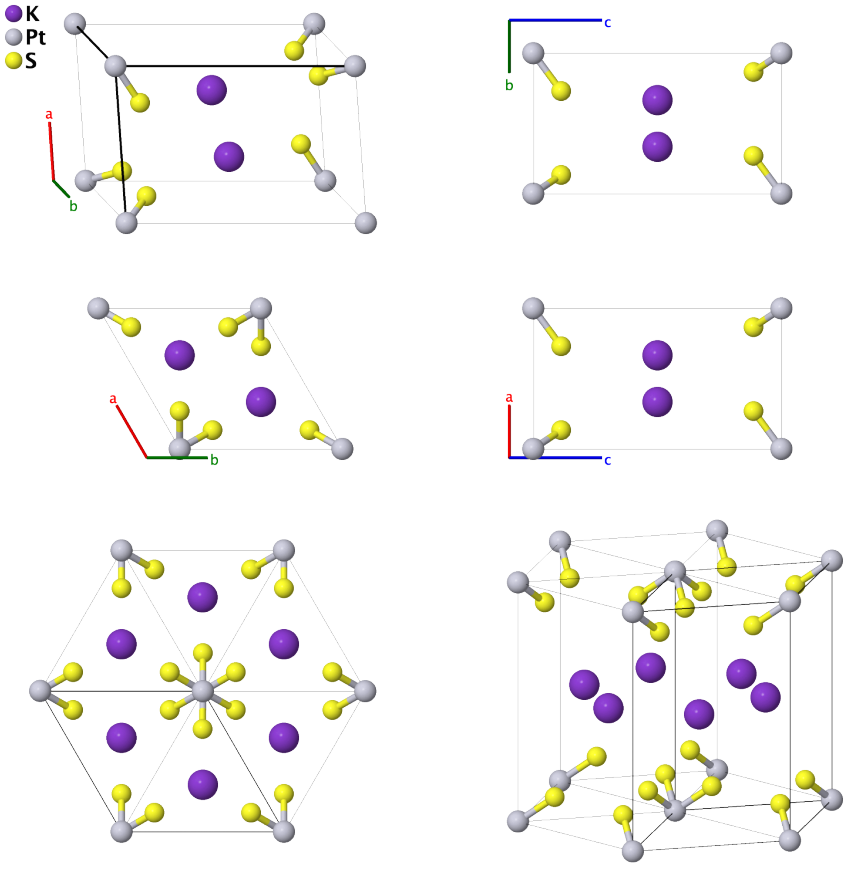
$K_2Pt(SCN)_6$ ($H6_3$) Structure: A2BC6_hP9_164_d_a_i

http://aflow.org/prototype-encyclopedia/A2BC6_hP9_164_d_a_i



Prototype	:	$K_2Pt(SCN)_6$
AFLOW prototype label	:	A2BC6_hP9_164_d_a_i
***Strukturbericht* designation**	:	$H6_3$
Pearson symbol	:	hP9
Space group number	:	164
Space group symbol	:	$P\bar{3}m1$
AFLOW prototype command	:	`aflow --proto=A2BC6_hP9_164_d_a_i --params=`$a, c/a, z_2, x_3, z_3$

Other compounds with this structure

- $(NH4)_2Pt(SCN)_6$ and $Rb_2Pt(SCN)_6$

- The structure here must be regarded at tentative. Even the "official" labeling of the structure is uncertain:
  - (Hendricks, 1928) made the only structural study of this compound that we have been able to find. Unfortunately, they were not able to determine the positions of the carbon and silicon atoms. Presumably $(SCN)^-$ forms a straight-line ionic system making a roughly 105° angle with the Pt-S line, as it does in the hydrated form of this compound $K_2Pt(SCN)_6 \cdot 2H_2O$.
  - (Hendricks, 1928) were also uncertain about the space group, giving two possibilities: $P\bar{3}1m$ #162 and $P\bar{3}m1$ #164. They prefer the latter, so we present this as a $P\bar{3}m1$ #164 structure.

- The positions of the potassium and sulfur ions are not well determined. (Hendricks, 1928) give $z_2 \approx 0.5$, $x_3 = 0.10 - 0.17$, and $z_3 = 0.09 - 0.135$. We used the average values for the S coordinates.
- While (Ewald, 1931) gave this the *Strukturbericht* designation $H6_3$, (Hermann, 1937) lists it as $I1_3$, "previously $H6_3$." However, they then go on to describe structures of the form $SrCl_2(H_2O)_6$, with a very different c/a ratio.
- (Ewald, 1931) originally used the $H6$ *Strukturbericht* category for compounds of the form $B(X)_6$, but (Hermann, 1937) and following volumes use both I and J for $B(X)_6$, sometimes changing a previous $H6$ designation to $I1$ or $J1$. In general we will follow this change in notation, but given the striking difference in structures between $K_2Pt(SCN)_6$ and $SrCl_2(H_2O)_6$ we will continue to use $H6_3$ for $K_2Pt(SCN)_6$ and $I1_3$ for $SrCl_2(H_2O)_6$.

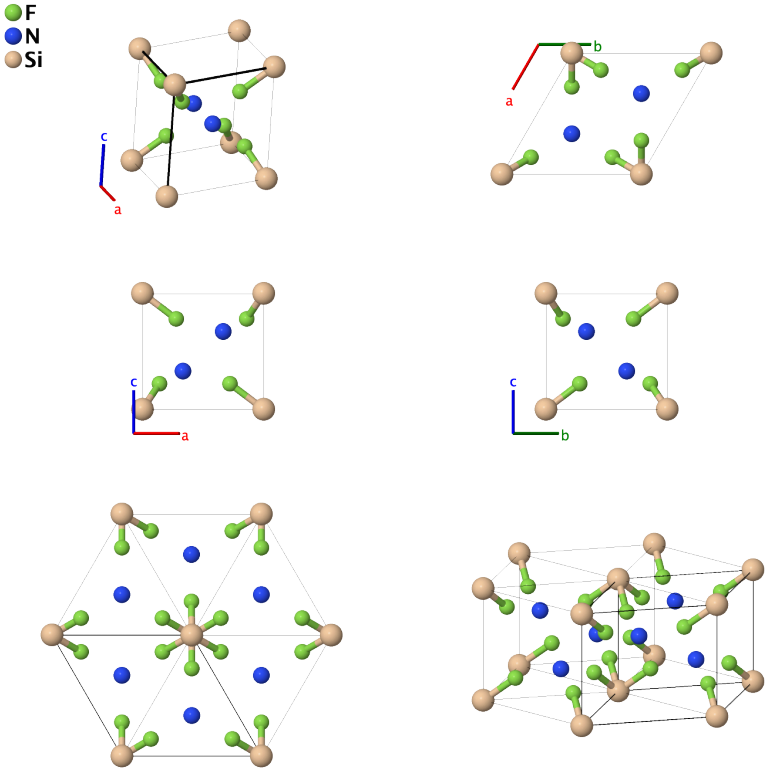
Bararite (Trigonal $(NH_4)_2SiF_6$, $J1_6$) Structure: A6B2C_hP9_164_i_d_a

http://aflow.org/prototype-encyclopedia/A6B2C_hP9_164_i_d_a



Prototype	:	$F_6(NH_4)_2Si$
AFLOW prototype label	:	A6B2C_hP9_164_i_d_a
***Strukturbericht* designation**	:	$J1_6$
Pearson symbol	:	hP9
Space group number	:	164
Space group symbol	:	$P\bar{3}m1$
AFLOW prototype command	:	`aflow --proto=A6B2C_hP9_164_i_d_a --params=`$a, c/a, z_2, x_3, z_3$

- Bararite is a trigonal form of $(NH_4)_2SiF_6$, metastable at room temperature. The room temperature stable form is cubic cryptohalite, which takes on the $J1_1$ structure. Except for the hydrogen atoms, this structure is very similar to $J1_{13}$, K_2GeF_6. (Schlemper, 1966) state that the hydrogen atoms are on ($2d$) and ($6i$) sites, but were not able to determine the coordinates because of large thermal fluctuations. They were to study the system at 77 K, but we have not found any evidence that this work was ever published.
- The positions of the hydrogen atoms in the NH_4 ions were not determined, so we only provide the positions of the nitrogen atoms (labeled as NH_4).

Trigonal Hexagonal primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{\sqrt{3}}{2}a\,\hat{\mathbf{y}}$$

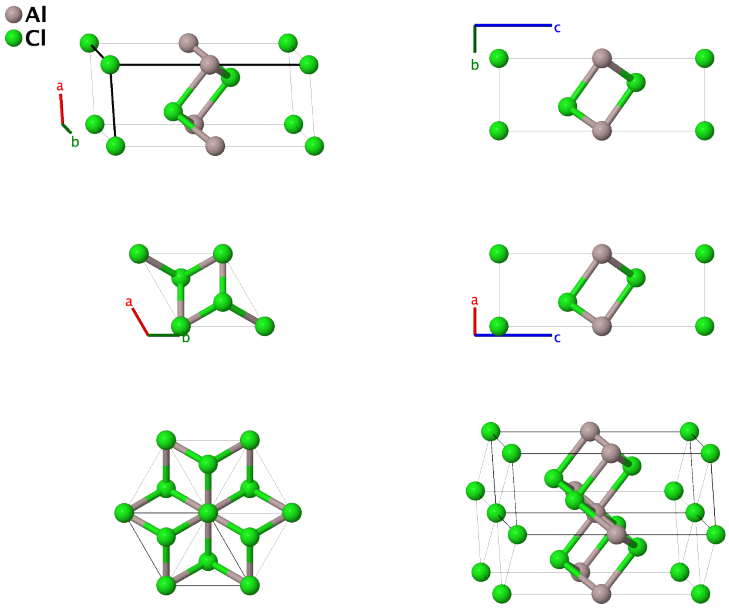
$D0_{13}$ ($AlCl_3$) (*obsolete*) Structure: AB3_hP4_164_b_ad

http://aflow.org/prototype-encyclopedia/AB3_hP4_164_b_ad



Prototype	:	$AlCl_3$
AFLOW prototype label	:	AB3_hP4_164_b_ad
***Strukturbericht* designation**	:	$D0_{13}$
Pearson symbol	:	hP4
Space group number	:	164
Space group symbol	:	$P\bar{3}m1$
AFLOW prototype command	:	`aflow --proto=AB3_hP4_164_b_ad --params=`$a, c/a, z_3$

- This structure was suggested by (Laschkarew, 1930) and designated as *Strukturbericht* $D0_{13}$ by (Hermann, 1937). However, in the next edition of *Strukturbericht*, (Gottfried, 1937) designated the $AlCl_3$ structure found by (Ketellar, 1935) as $D0_{15}$. This structure, however, has a lower symmetry than the currently accepted structure, which we previously designated $D0_{15}$ and is body-centered orthorhombic, space group $C2/m$ #12.

Trigonal Hexagonal primitive vectors:

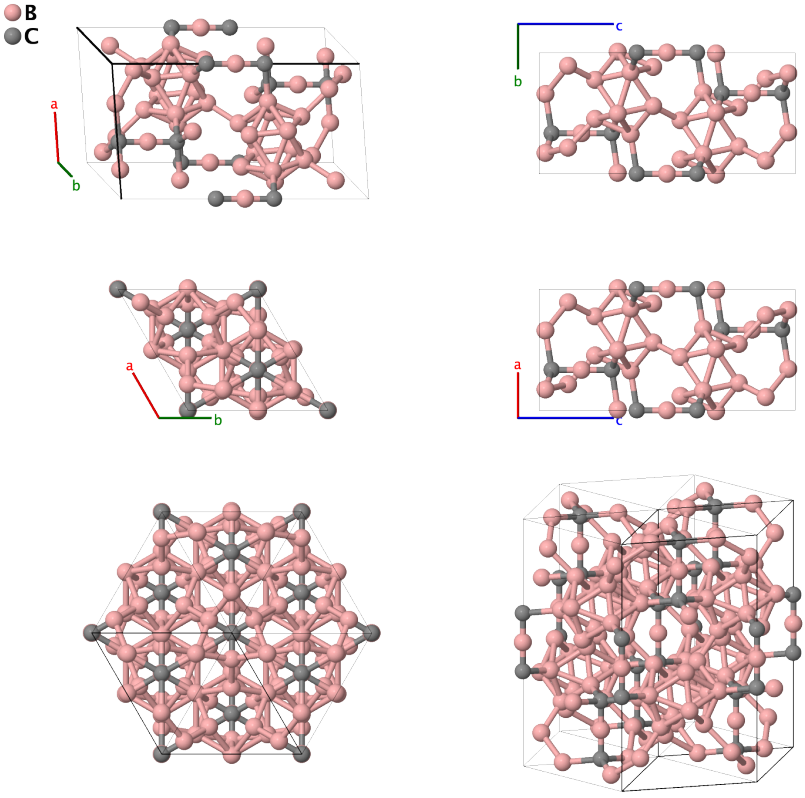
$B_{13}C_2$ "B_4C" ($D1_g$) Structure: A13B2_hR15_166_b2h_c

http://aflow.org/prototype-encyclopedia/A13B2_hR15_166_b2h_c



Prototype	:	$B_{13}C_2$
AFLOW prototype label	:	A13B2_hR15_166_b2h_c
***Strukturbericht* designation**	:	$D1_g$
Pearson symbol	:	hR15
Space group number	:	166
Space group symbol	:	$R\bar{3}m$
AFLOW prototype command	:	`aflow --proto=A13B2_hR15_166_b2h_c [--hex] --params=`$a, c/a, x_2, x_3, z_3, x_4, z_4$

Other compounds with this structure

- $B_{1-x}C_x$ ($0.08 < x < 0.20$) and $B_{13}P_2$, B_4Si, B_6O

- This structure has a rather complicated history:
  - It is difficult to determine the species of atoms at a given site because of the similar electronic and nuclear cross sections of ^{11}B and ^{12}C (Domnich, 2011).
  - Early investigations (Clark, 1943) assumed the structure was B_4C, with the extra carbon atom replacing the boron on the (1*b*) site. [Note that Clark has an error in the coordinates of one set of boron atoms, giving a boron-boron distance of less than 1 Å. This error is repeated in (Brandes, 1992) and (Wykcoff, 1964).]

– In reality, concentrations can range from 8-20% carbon (Domnich, 2011).
– (Larson, 1986) states that the (1*b*) site in $B_{13}C_2$ is boron, and as the structure becomes more carbon-rich the carbon atoms replace boron in the icosahedra. We follow this and use the structure determined by (Will, 1976) as our reference.
– (Lazzari, 1999) states that excess electrons go on the "polar" sites of the icosahedron, *i.e.* the sites closest to the carbon atoms on the chains (the B-III atoms in our notation).

Rhombohedral primitive vectors:

$$\begin{aligned}
\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}} \\
\mathbf{a}_2 &= \tfrac{1}{\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}} \\
\mathbf{a}_3 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}
\end{aligned}$$

AFLOW prototype command	:	`aflow --proto=A5B21C24D12_hR62_166_a2c_ehi_fg2h_i [--hex] --params=`$a, c/a, x_2, x_3, x_5, x_6, x_7, z_7, x_8, z_8, x_9, z_9, x_{10}, y_{10}, z_{10}, x_{11}, y_{11}, z_{11}$

- The structure given here, from (Calligaris, 1982), has substantially the same Wyckoff positions as the structure desig-

nated $S\,3_4$ by (Gottfried, 1937). The largest change is the splitting of the calcium site from one stoichiometric ($2c$) site to three partially filled sites, one ($1a$) and two ($2c$).

- (Calligaris, 1982) did not give the exact positions of the water molecules, so we use the positions given by (Downs, 2003). However, this leaves us with only 7.7 water molecules per formula unit, rather than the 13 claimed by (Calligaris, 1982).
- Only the oxygen sites are fully occupied. For the remaining sites, according to (Downs, 2003),
  - The ($1a$) site is 9.06% Ca and 1.94% Sr, with the remaining sites vacant.
  - The first ($2c$) site is 43.65% Ca and 9.35% Sr.
  - The second ($2c$) site is 19.76% Ca and 4.24% Sr.
  - The ($3e$) is only occupied by a water molecule 50% of the time.
  - The ($6h$) H_2O site is only occupied 57% of the time.
  - The ($12i$) H_2O site is only occupied 23% of the time.
  - The remaining ($12i$) is 69% Si and 31% Al.
- (Gottfried, 1937) gave chabazite the *Strukturbericht* designation $S\,3_4$. However, (Gottfried, 1940) ignored this and designated catapleiite, $Na_2ZrSi_3O_9{\cdot}2H_2O$ as *Strukturbericht* $S\,3_4$. We resolve this by using $S\,3_4$ (I) to designate chabazite and $S\,3_4$ (II) to designate catapleiite.

Rhombohedral primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\end{aligned}$$

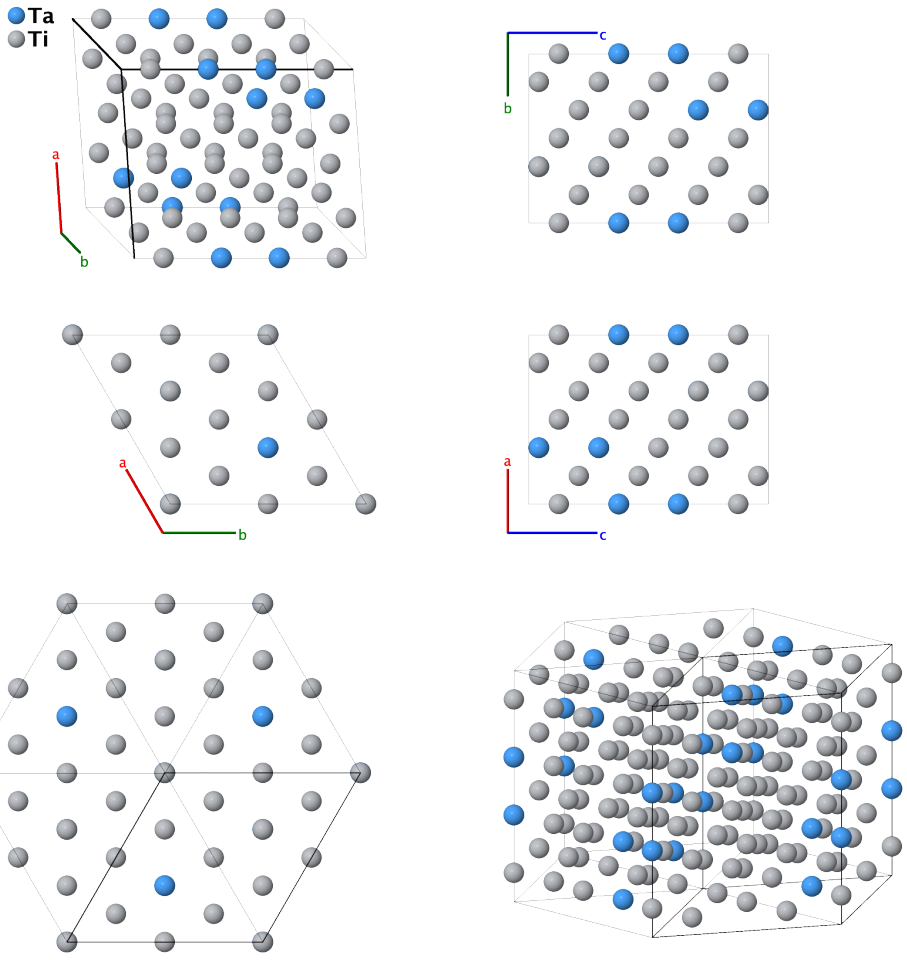
$TaTi_7$ (BCC SQS-16) Structure: AB7_hR16_166_c_c2h

http://aflow.org/prototype-encyclopedia/AB7_hR16_166_c_c2h



Prototype	:	$TaTi_7$
AFLOW prototype label	:	AB7_hR16_166_c_c2h
***Strukturbericht* designation**	:	None
Pearson symbol	:	hR16
Space group number	:	166
Space group symbol	:	$R\bar{3}m$
AFLOW prototype command	:	`aflow --proto=AB7_hR16_166_c_c2h [--hex] --params=`$a, c/a, x_1, x_2, x_3, z_3, x_4, z_4$

- This is a special quasirandom structure with 16 atoms per unit cell (SQS-16) for the β-phase (high-temperature austenite) bcc substitutional Ti-Ta alloy (Chakraborty, 2016). This protoype contains 12.5% Ta. Prototypes are listed for other Ta-Ti concentrations: 18.75% Ta (A3B13_oC32_38_ac_a2bcdef), 25% Ta (AB3_mC32_8_4a_4a4b), 31.25% Ta (A5B11_mP16_6_2abc_2a3b3c), and 37.5% Ta (A3B5_oC32_38_abce_abcdf).

Rhombohedral primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\end{aligned}$$

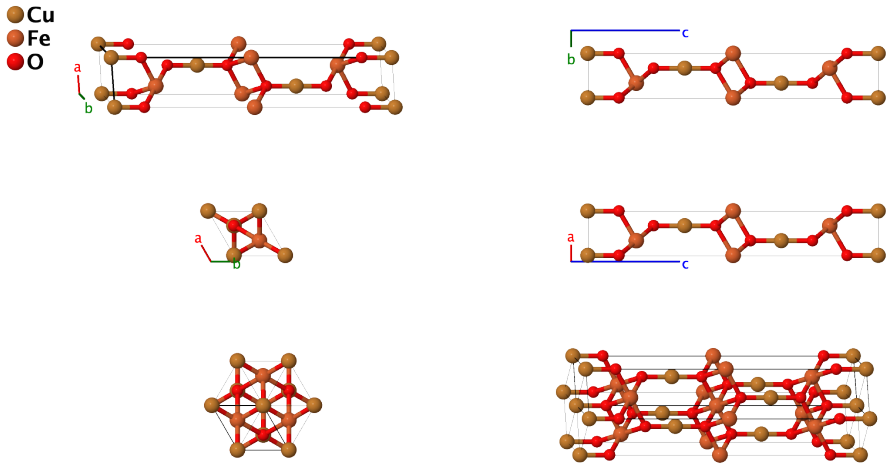
Rhombohedral Delafossite ($CuFeO_2$) Structure: ABC2_hR4_166_a_b_c

http://aflow.org/prototype-encyclopedia/ABC2_hR4_166_a_b_c.CuFeO2



Prototype	:	$CuFeO_2$
AFLOW prototype label	:	ABC2_hR4_166_a_b_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	hR4
Space group number	:	166
Space group symbol	:	$R\bar{3}m$
AFLOW prototype command	:	`aflow --proto=ABC2_hR4_166_a_b_c [--hex] --params=`$a, c/a, x_3$

Other compounds with this structure

- $AgAlO_2$, $AgCoO_2$, $AgCrO_2$, $AgFeO_2$, $AgGaO_2$, $AgInO_2$, $AgNiO_2$, $AgRhO_2$, $AgScO_2$, $AgTlO_2$, $CuAlO_2$, $CuCoO_2$, $CuCrO_2$, $CuEuO_2$, $CuGaO_2$, $CuInO_2$, $CuLaO_2$, $CuRhO_2$, $CuScO_2$, $CuYO_2$, $PdCoO_2$, $PdCrO_2$, $PdRhO_2$, and $PtCoO_2$

- Delafossite appears in two forms which differ in the stacking of the layers: rhombohedral, shown here, and hexagonal, prototype $CuAlO_2$. Most of the compounds found in the hexagonal phase can also be found in the rhombohedral structure (Marquardt, 2006).
- Rhombohedral delafossite has the same AFLOW label, ABC2_hR4_166_a_b_c, as caswellsilverite $F5_1$. The difference in the internal parameter z_3 causes a large change in the bonding of the two crystals, so we present them as different structures.

Rhombohedral primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = -\frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$

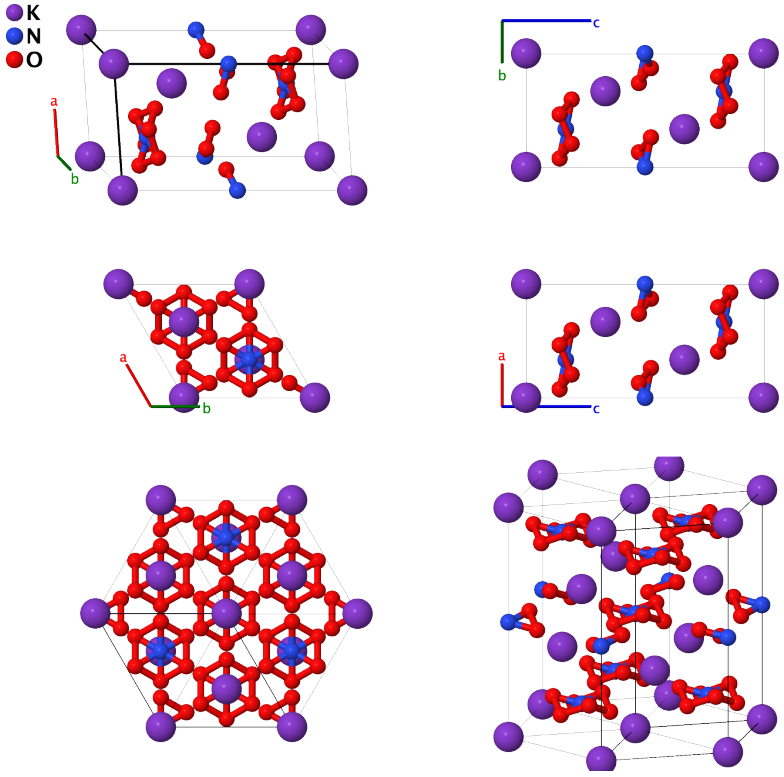
β-Potassium Nitrate (KNO_3) Structure: ABC6_hR8_166_a_b_h

http://aflow.org/prototype-encyclopedia/ABC6_hR8_166_a_b_h



Prototype	:	KNO_3
AFLOW prototype label	:	ABC6_hR8_166_a_b_h
***Strukturbericht* designation**	:	None
Pearson symbol	:	hR8
Space group number	:	166
Space group symbol	:	$R\bar{3}m$
AFLOW prototype command	:	`aflow --proto=ABC6_hR8_166_a_b_h [--hex] --params=`$a, c/a, x_3, z_3$

- On heating, α-KNO_3 (either Structure I or Structure II) transforms into β-KNO_3 at 128 °C. When heated above 200 °C and then cooled, the β phase transforms into the metastable ferroelectric γ-KNO_3 phase, which can remain down to room temperature.
- In the β-phase the oxygen ($6h$) sites are only 50% filled. Presumably only the $+z$ or $-z$ sites will be occupied around a given nitrogen atom.
- (Nimmo, 1976) give the data for β-KNO_3 taken at 151 °C.

Rhombohedral primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}\,a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \frac{1}{3}\,c\,\hat{\mathbf{z}}$$

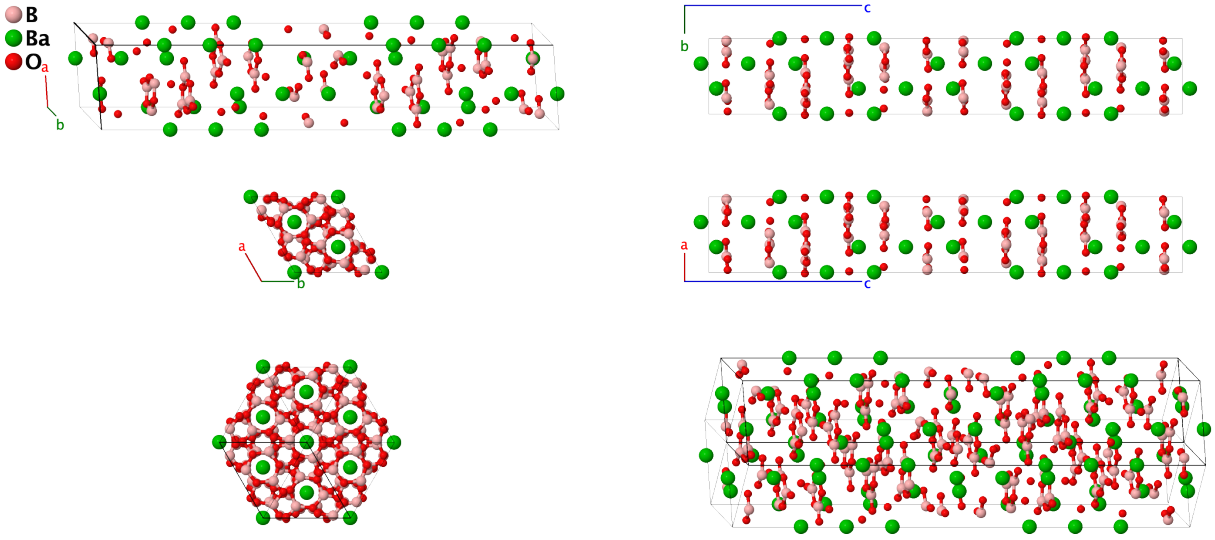
β-BaB_2O_4 (High-Temperature) Structure: A2BC4_hR42_167_f_ac_2f

http://aflow.org/prototype-encyclopedia/A2BC4_hR42_167_f_ac_2f



Prototype	:	B_2BaO_4
AFLOW prototype label	:	A2BC4_hR42_167_f_ac_2f
***Strukturbericht* designation**	:	None
Pearson symbol	:	hR42
Space group number	:	167
Space group symbol	:	$R\bar{3}c$
AFLOW prototype command	:	`aflow --proto=A2BC4_hR42_167_f_ac_2f [--hex] --params=`$a, c/a, x_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5$

- This is the high-temperature structure of BaB_2O_4. Cooling to temperatures between 100-400 °C, it transforms into α-BaB_2O_4. The principle difference between the two forms is the lack of inversion symmetry in the low-temperature structure.
- This structure was determined by cooling liquid BaB_2O_4 to room temperature.

Rhombohedral primitive vectors:

$$\mathbf{a}_1 = \frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_2 = \frac{1}{\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$
$$\mathbf{a}_3 = -\frac{1}{2}a\,\hat{\mathbf{x}} - \frac{1}{2\sqrt{3}}a\,\hat{\mathbf{y}} + \frac{1}{3}c\,\hat{\mathbf{z}}$$

- (Hoard, 1935) followed by (Downs, 2003), give the atomic coordinates in the style of (Wyckoff, 1922), who lists space group D^6_{3d} (the Schönflies notation for space group $R\bar{3}c$) as space group #203, instead of #167, and uses an origin which

corresponds to (1/4, 1/4, 1/4) in our lattice coordinates. We used FINDSYM to convert this into our standard setting for space group #167.

Rhombohedral primitive vectors:

$$\begin{aligned}\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_2 &= \tfrac{1}{\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\\ \mathbf{a}_3 &= -\tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{1}{2\sqrt{3}}\,a\,\hat{\mathbf{y}} + \tfrac{1}{3}\,c\,\hat{\mathbf{z}}\end{aligned}$$

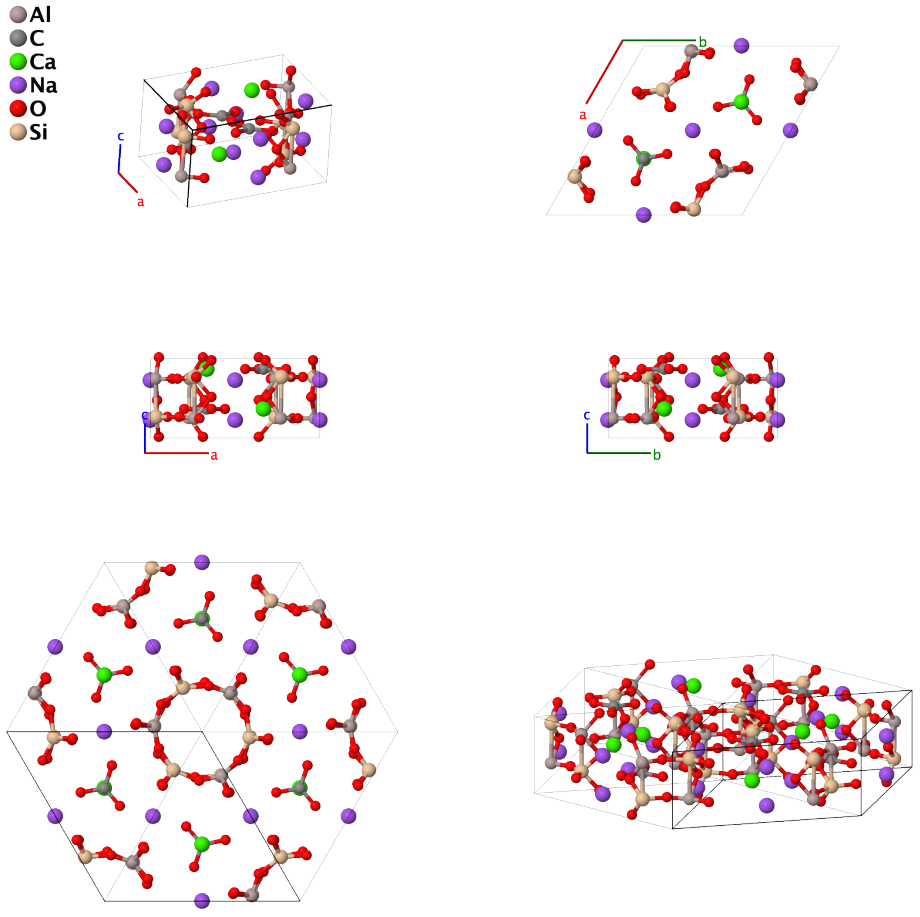
Crancrinite ($Na_6Ca_2Al_6Si_6O_{24}(CO_3)_2$, $S\,3_3$ (I)) Structure: A3BCD3E15F3_hP52_173_c_b_b_c_5c_c

http://aflow.org/prototype-encyclopedia/A3BCD3E15F3_hP52_173_c_b_b_c_5c_c



Prototype	:	$Al_3CCaNa_3O_{15}Si_3$
AFLOW prototype label	:	A3BCD3E15F3_hP52_173_c_b_b_c_5c_c
***Strukturbericht* designation**	:	$S\,3_3$ (I)
Pearson symbol	:	hP52
Space group number	:	173
Space group symbol	:	$P6_3$
AFLOW prototype command	:	`aflow --proto=A3BCD3E15F3_hP52_173_c_b_b_c_5c_c --params=`$a, c/a, z_1, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6, x_7, y_7, z_7, x_8, y_8, z_8, x_9, y_9, z_9, x_{10}, y_{10}, z_{10}$

- The term "crancrinite" covers a wide range of mineral compositions, some of which may include OH radicals and H_2O molecules. We use this early determination of the structure as the base.
- There are two major inconsistencies between (Kozu, 1933) and (Gottfried, 1937):
  - (Gottfried, 1937) interchanges the z coordinates of the carbon and calcium ions compared to (Kozu, 1933). Kozu's coordinates are consistent with CO_3 radicals, so we use their version.

  - (Kozu, 1933) gives $x_{10} = 0.33$ for the x coordinate of silicon. This puts the silicon atoms very close to carbon. We follow (Gottfried, 1937) and take $x_{10} = 0.033$, which gives a reasonable distance.

- (Gottfried, 1937) gave this structure the label $S\,3_3$, but later (Gottfried, 1938) gave the same label to parawollastonite, $CaSiO_3$. We will refer to crancrinite as $S\,3_3$ (I), and parawollastonite as $S\,3_3$ (II).

Hexagonal primitive vectors:

$$\begin{aligned}
\mathbf{a}_1 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} - \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}} \\
\mathbf{a}_2 &= \tfrac{1}{2}\,a\,\hat{\mathbf{x}} + \tfrac{\sqrt{3}}{2}\,a\,\hat{\mathbf{y}} \\
\mathbf{a}_3 &= c\,\hat{\mathbf{z}}
\end{aligned}$$

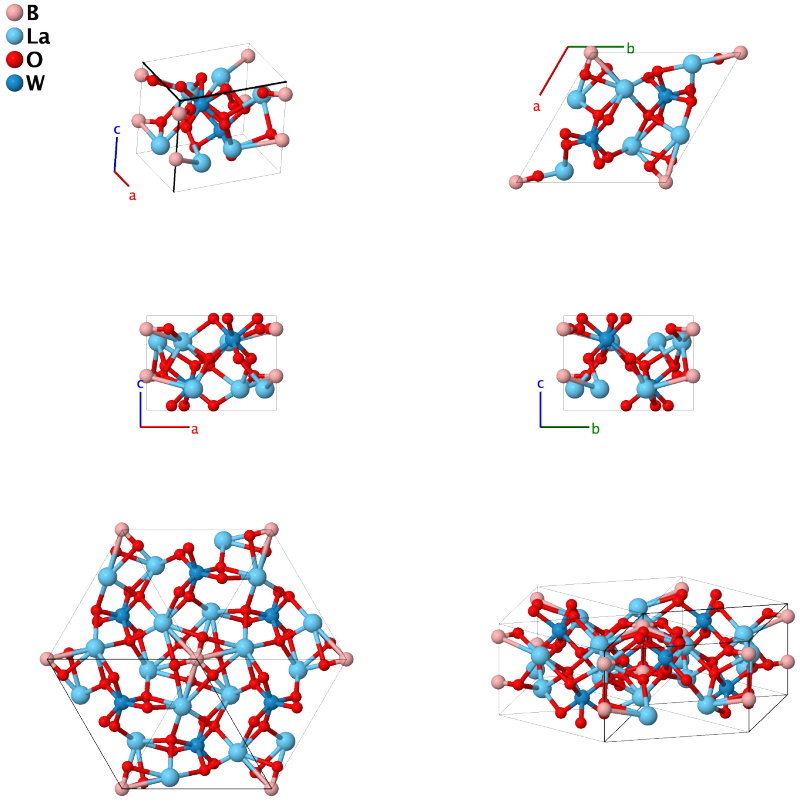
La_3BWO_9 ($P6_3$) Structure: AB3C9D_hP28_173_a_c_3c_b

http://aflow.org/prototype-encyclopedia/AB3C9D_hP28_173_a_c_3c_b



Prototype	:	BLa_3O_9W
AFLOW prototype label	:	AB3C9D_hP28_173_a_c_3c_b
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP28
Space group number	:	173
Space group symbol	:	$P6_3$
AFLOW prototype command	:	`aflow --proto=AB3C9D_hP28_173_a_c_3c_b --params=`$a, c/a, z_1, z_2, x_3, y_3, z_3, x_4, y_4, z_4, x_5, y_5, z_5, x_6, y_6, z_6$

Other compounds with this structure

- La_3BWO_9, Ce_3BWO_9, Nd_3BWO_9, Sm_3BWO_9, Gd_3BWO_9, Tb_3BWO_9, Dy_3BWO_9, and Ho_3BWO_9

- Most refinements of the BLa_3O_9W structure, including (Ashtar, 2020) place it in hexagonal space group $P6_3$ #173. (Han, 2018) find a better fit to the data by refining it in the trigonal $P3$ #143 space group, which places the lanthanum atoms on two independent crystallographic sites. As this may be due to the presence of bismuth impurities, which (Han, 2018) place on the lanthanum site, while (Ashtar, 2020) claim to have very pure samples, we withhold judgment on which structure is correct and present both.
- Space group $P6_3$ does not specify the origin of the z-axis. Here it is set so that the coordinate of the tungsten atom is $z_2 = 1/4$.

Hexagonal primitive vectors:

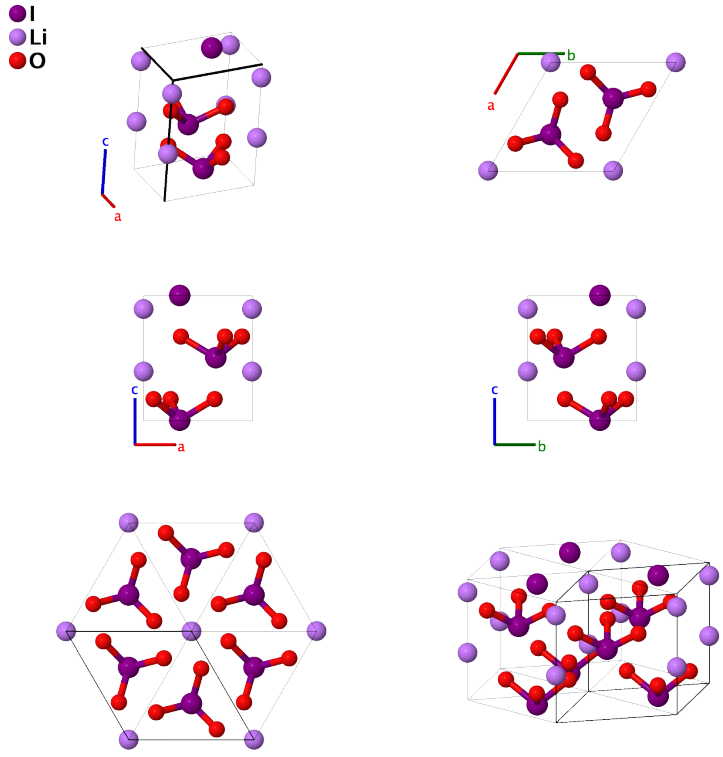
α-$LiIO_3$ Structure: ABC3_hP10_173_b_a_c

http://aflow.org/prototype-encyclopedia/ABC3_hP10_173_b_a_c



Prototype	:	$ILiO_3$
AFLOW prototype label	:	ABC3_hP10_173_b_a_c
***Strukturbericht* designation**	:	None
Pearson symbol	:	hP10
Space group number	:	173
Space group symbol	:	$P6_3$
AFLOW prototype command	:	`aflow --proto=ABC3_hP10_173_b_a_c --params=`$a, c/a, z_1, z_2, x_3, y_3, z_3$

- $LiIO_3$ is known to exist in three forms:
  - α-$LiIO_3$, stable below 470 K: (Zachariasen, 1931) originally determined that the structure of α-$LiIO_3$ was in space group $P6_322$ #182, which (Hermann, 1937) designated *Strukturbericht* $E2_3$. (Rosenzweig, 1966) subsequently determined that this structure was incorrect because of the small sample size, and determined that the true structure was in space group $P6_3$ #173.
  - β-$LiIO_3$, stable from 573 up to the melting point at 708 K.
  - γ-$LiIO_3$, stable between the α- and β-phases, with an orthorhombic structure in space group $Pna2_1$ #33.

Hexagonal primitive vectors:

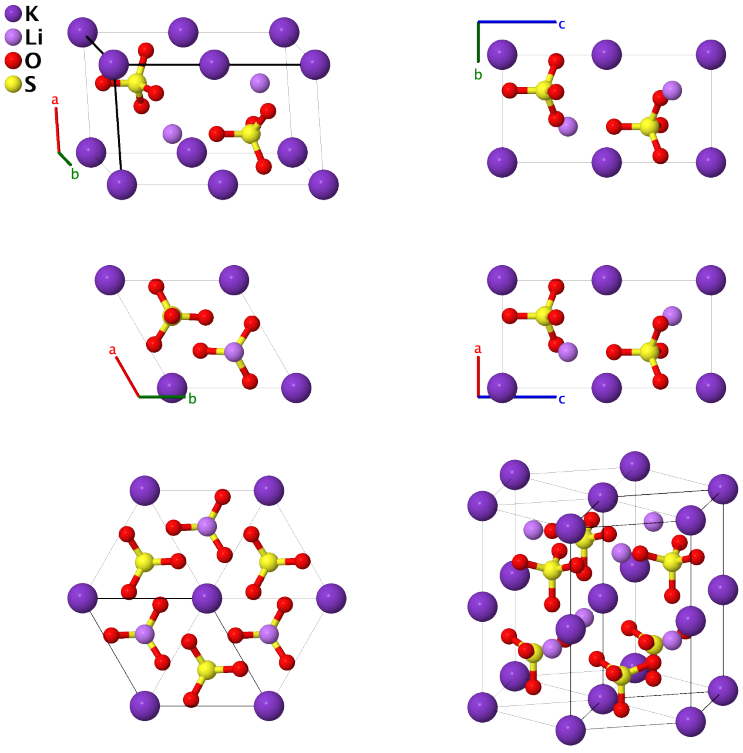
$LiKSO_4$ ($H1_4$) Structure: ABC4D_hP14_173_a_b_bc_b

http://aflow.org/prototype-encyclopedia/ABC4D_hP14_173_a_b_bc_b



Prototype	:	$KLiO_4S$
AFLOW prototype label	:	ABC4D_hP14_173_a_b_bc_b
***Strukturbericht* designation**	:	$H1_4$
Pearson symbol	:	hP14
Space group number	:	173
Space group symbol	:	$P6_3$
AFLOW prototype command	:	`aflow --proto=ABC4D_hP14_173_a_b_bc_b --params=`$a, c/a, z_1, z_2, z_3, z_4, x_5, y_5, z_5$

- As there is no center of symmetry in the structure, the point $z = 0$ can be set arbitrarily. Following (Bhakay-Tamhane, 1984) we set $z_1 = 0$.
- While *Strukturbericht* symbols $H1_1$, $H1_2$ and $H1_5$ are identical with $S1_1$, $S1_2$ and $S1_5$, respectively, there is no connection between this structure and $S1_4$, garnet (A2B3C12D3_cI160_230_a_c_h_d).

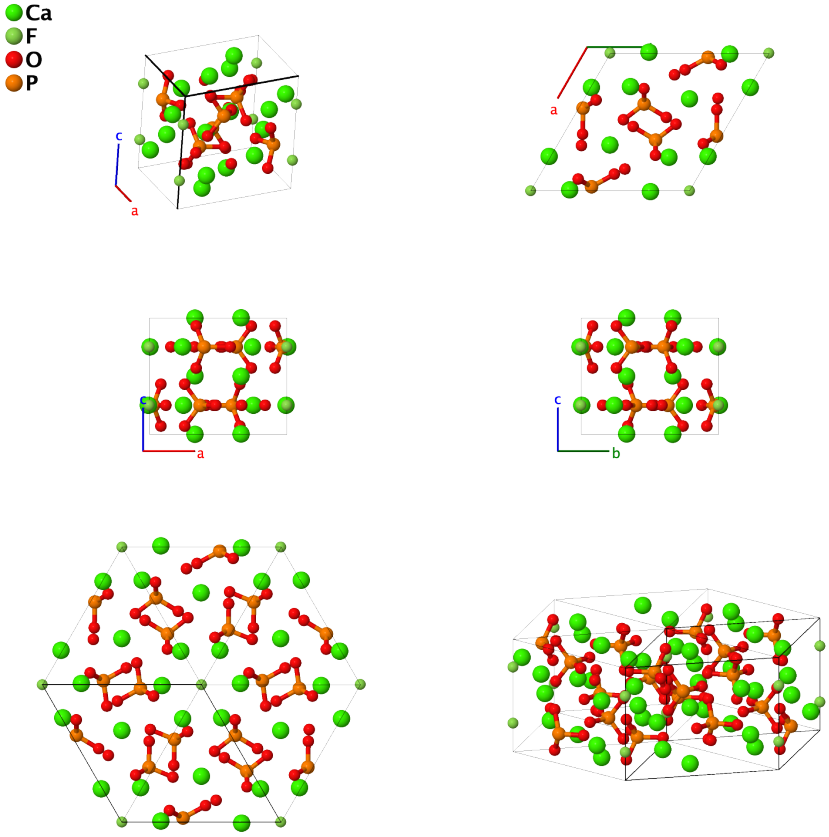
Fluorapatite [$Ca_5F(PO_4)_3$, $H5_7$] Structure: A5BC12D3_hP42_176_fh_a_2hi_h

http://aflow.org/prototype-encyclopedia/A5BC12D3_hP42_176_fh_a_2hi_h



Prototype	:	$Ca_5FO_{12}P_3$
AFLOW prototype label	:	A5BC12D3_hP42_176_fh_a_2hi_h
***Strukturbericht* designation**	:	$H5_7$
Pearson symbol	:	hP42
Space group number	:	176
Space group symbol	:	$P6_3/m$
AFLOW prototype command	:	`aflow --proto=A5BC12D3_hP42_176_fh_a_2hi_h --params=`$a, c/a, z_2, x_3, y_3, x_4, y_4, x_5, y_5, x_6, y_6, x_7, y_7, z_7$

Other compounds with this structure

- $Ca_5OH(PO_4)_3$ (hydroxylapatite) and $Ca_5Cl(PO_4)_3$ (chlorapatite)

- Apatite can be formed with most M^{2+} metallic ions replacing the calcium, and many ions (AsO_3, CO_3, Si_3, *etc.*) replacing the phosphate. While these structures are related to the prototype, they may have slight changes in crystal structure. The phosphate apatites are the main source of phosphorus on Earth (Hughes, 2002).

- When OH or Cl replaces F, that ion is displaced from the ($2a$) position to the ($4e$) position, with $z = 0.1979$ for OH and 0.4323 for Cl. The substitute ion fills half of the ($4f$) sites.

Hexagonal primitive vectors:
